Study information

Scientific Title

Effects of dietary protein restriction on albumin and fibrinogen synthesis in macroalbuminuric Diabetes Mellitus type 2 (DM2) subjects

Acronym

DM2LPD study

Study objectives

Dietary protein restriction on albumin and fibrinogen synthesis.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Approval received from the Ethics committee of Second University of Naples (Comitato Etico Azienda Ospedaliera Universitaria - SUN) in 2005.

Study design

Interventional, randomised prospective clinical trial

Primary study design

Interventional

Secondary study design

Randomised controlled trial

Study setting(s)

Hospital

Study type(s)

Treatment

Participant information sheet

Health condition(s) or problem(s) studied

Diabetes mellitus and nephropathy

Interventions

We compared the effects of a Normal Protein Diet (NPD) (1.38 ± 0.08 g/kg/day) or a Low Protein Diet (LPD) (0.81 ± 0.04 g/kg/day) on Endogenous Leucine Flux (ELF), albumin and fibrinogen synthesis (5,5,5,-D3-L-leucine infusion), and markers of inflammation, in 9 subjects with DM2 and macroalbuminuria.

The duration of treatment is 4 weeks pre-LPD and 4 weeks post-LPD. The total duration of follow-up for all treatment arms is 8 weeks.

Intervention Type

Other

Phase

Not Specified

Primary outcome measure

Albumin and fibrinogen synthesis, measured at baseline and four weeks pre-LPD and post-LPD.

Secondary outcome measures

Proteinuria and low-grade inflammation, measured at baseline and four weeks pre-LPD and post-LPD.

Overall study start date

05/01/2005

Completion date

07/07/2006

Eligibility**Key inclusion criteria**

Eligibility criteria of type 2 diabetic patients included:

1. Body Mass Index (BMI) less than 35 kg/m²
2. Proteinuria greater than 3 g/day
3. Absence of urinary tract infection or other renal diseases

Age range and gender of our participants are:

1. DM2 (60 ± 2 years): 6 males, 3 females
2. Control (37 ± 3 years): 3 males and 3 females
