Study information

Scientific Title

Acronym

DEPKR-Trial

Study objectives

To compare two different surgical techniques for the treatment of chronic pancreatitis with regard to complication rates, length of operation, length of intensive care treatment, length of hospital stay, exocrine/endocrine pancreatic function and quality of life.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Ethics approval received from the Independent Ethics Committee of the University of Heidelberg.

Treatment

Participant information sheet

Health condition(s) or problem(s) studied

Chronic pancreatitis

Interventions

Every patient eligible for pancreatic head resection due to chronic pancreatitis will be asked for informed consent and will be thereafter intraoperatively randomised to either Beger's or the Berne modification of duodenum-preserving pancreatic head resection. A standardised surgical abdominal approach is performed in preparing the pancreatic head. The randomisation will

proceed when the intraoperative decision for resection of the pancreatic head is made. The comparison of specific primary and secondary endpoints will assess the superiority of one technique. Patients will be followed up for 24 months.

Intervention Type

Other

Phase

Not Specified

Primary outcome measure

The primary endpoint is combined out of four components. In order to adjust for multiple testing a hierarchical model is used.

- 1. Duration of surgical procedure [min]
- 2. Quality of life (EORTC QLQ-C30 questionnaire and the disease specific module for pancreatic diseases EORTC QLQ-PAN26) at 12 months after the intervention
- 3. Duration of stay on the intensive care unit
- 4. Duration of postoperative hospital stay

Secondary outcome measures

Frequencies of early and late onset complications such as intra- or postoperative bleeding with subsequent need for blood transfusion, pancreatic fistula, postoperative pulmonary complications, wound infections and re-laparotomy; exocrine and endocrine pancreatic function as determined by levels of HbA1c and stool elastase.

Overall study start date

01/09/2003

Completion date

01/10/2007

Eligibility

Key inclusion criteria

Patients undergoing elective duodenum-preserving pancreatic head resection due to chronic pancreatitis.

Eligibility criteria:

- 1. Patients of any age (greater than 18 years)
- 2. Expected survival time more than 24 months
- 3. Informed consent

Participant type(s)

Patient

Age group

Adult

Lower age limit

Sex

Both

Target number of participants

65

Key exclusion criteria

- 1. Participation in another intervention trial that would interfere with the intervention and outcome of this study
- 2. Severe psychiatric disorders or neurological diseases
- 3. Lack of compliance
- 4. Drug and/or alcohol abuse according to local standards
