Study information

Scientific Title

The effect of a novel polysaccharide blend (PGX® micro-granules) on short-term weight loss and other laboratory parameters in overweight and obese adults: an observational retrospective analysis

Study objectives

The purpose of this observational retrospective analysis is to examine the efficacy of PGX® micro-granules on weight loss, body mass index, waist circumference, waist-hip ratio, plus laboratory measurements including total and Low Density Lipoprotein (LDL) cholesterol, triglycerides, fasting insulin, fasting glucose and two hour glucose tolerance test for 14 weeks in overweight and obese adults enrolled in a voluntary community weight loss program.

Ethics approval required

Old ethics approval format

Ethics approval(s)

A research ethics review was not performed on this project as this was not intended to be a study at the outset. These were patients we worked with in the course of our clinical practice. After the weight loss clinical program, we performed a retrospective analysis of clinical outcomes.

Study design

An observational retrospective program design.

Overweight/obesity

Interventions

Subjects gave their written consent for participation in the program and were required to attend group lectures on general health, diet, and exercise, every two weeks given by Dr Lyon for a 14 week period. During the 14 week program, volunteers were required to take up to 10 grams of PGX® micro-granules with 12 to 16 oz of water in divided doses throughout the day.

PGX® micro-granules

Primary outcome measure

Primary outcomes measured for all participants are weight (pounds), waist and hip circumference, and percent body fat. Percent body fat was determined using bioelectrical impedance testing at baseline and every two weeks thereafter.

Secondary outcome measures

All subjects enrolled in the program were initially evaluated for High Density Lipoprotein (HDL), LDL, total cholesterol, triglycerides, fasting glucose, fasting insulin, two hour fasting insulin, and 75 gram glucose tolerance test at baseline, only those with aberrant risk factors were re-tested using the latter laboratory parameters at week 14.

Overall study start date

01/06/2005

Completion date

30/09/2005

Eligibility**Key inclusion criteria**

1. 20 to 65 year of age
2. Body mass index range of approximately 23 kg/m² to 35 kg/m²
3. Otherwise healthy

Participant type(s)

Patient

Age group

Adult

Sex
