Study information

Scientific Title

Study objectives

- 1. To examine the relationship between magnetic resonance imaging (MRI) indices and the severity of cognitive symptoms (e.g. poor memory and concentration)
- 2. To evaluate whether Rivastigmine Tartrate has a beneficial effect on the cognitive performance of patients with MS

Ethics approval required

Old ethics approval format

Ethics approval(s)

Not provided at time of registration

Study design

Randomised placebo controlled crossover group trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Multiple sclerosis (MS)

Interventions

Randomised placebo controlled, single dose, crossover trial with MRI and behavioural endpoints.

Intervention Type

Other

Phase

Not Specified

Primary outcome(s)

- 1. Behavioural data during performance of the functional imaging task and in the formal cognitive assessment
- 2. Absolute measures of signal intensity change in regions of interest in the functional scan
- 3. Lesion load on T1 and T2 weighted MRI scans
- 4. The percentage of the white matter in the patient that has T1 values greater than normal

Key secondary outcome(s))

- 1. Behavioural effect on other tasks within the neuropsychological battery
- 2. Possible side effects

Completion date

01/11/2003

Eligibility

Key inclusion criteria

12 Healthy people. 24 Patients.

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Sex

All

Key exclusion criteria

Not provided at time of registration

Date of first enrolment

01/11/2000

Date of final enrolment

01/11/2003

Locations

Countries of recruitment

United Kingdom

England
