Plain English summary of protocol

Background and study aims

The aim of this study is to compare two different steroid treatments in children and young people with new-onset polyarticular juvenile idiopathic arthritis (JIA) to find out which is best. Medications used in the long-term management of JIA take around 12 weeks to start working. Steroids act quickly, reducing inflammation whilst the other medications start to work but have many potential side effects. There is a lack of evidence to suggest whether intravenous steroids or oral steroids are more effective, safe, tolerable for patients and which have a greater impact on quality of life.

Who can participate?

Patients aged 1-18 years of age with at least five inflamed joints and newly diagnosed polyarticular JIA

What does the study involve?

They will be randomly allocated to either a 6-week course (reducing dose regimen) of prednisolone liquid or tablets, taken at home OR a 3-day course of intravenous methylprednisolone on a hospital day-case unit. Participants will be assessed before starting treatment (baseline) and four follow-up visits at 6, 12, 24 and 52 weeks, in line with standard care appointments. Study visits will include assessments in standard care however, additional study-specific assessments will include reporting of side effects, and steroid toxicity risk including extra blood tests, questionnaires relating to the impact of JIA and treatment on quality of life and cost. The study offers an option for participants to donate blood samples for storage in a biobank for future research. Samples will not be analysed as part of the study but adopted by Liverpool University Biobank.

What are the possible benefits and risks of participating?

The direct burden on participation will be minimal as all research visits have been scheduled at the same time as standard-of-care visits to minimise the burden to participants. Research blood samples are taken at the same time as standard-of-care bloods to reduce burden. Participants will be asked to complete several questionnaires which will prolong their clinic appointments. Once complete the questionnaire will be handed to the research team. Risks associated with being treated with steroids (the IMP and the comparator) via different routes for JIA with the IMP, These risks are stated in the trial information sheets and site teams are appropriately trained as both routes of administration are used as standard of care. All of the above risks are minimized with appropriate training and following policies and procedures by hospital Trusts and as stated in the protocol. For participants receiving oral prednisolone from hospital pharmacies, the pharmacy will dispense the drug as prescribed with appropriate guidance for taking it. For participants receiving IV methylprednisolone over 3 days on a hospital day unit, nurses who normally work on the day unit and have been appropriately trained to give IV methylprednisolone will be responsible for administering the drug and monitoring participants. It will not be given by Research Nurses who may be less familiar with the administration of this drug and do not usually administer this drug. This will minimize the risk of drug preparation, administration and monitoring errors.

Where is the study run from? Alder Hey Children's NHS Foundation Trust (UK)

When is the study starting and how long is it expected to run for? July 2023 to December 2026

Who is funding the study? Health Technology Assessment Programme (UK)

Who is the main contact? star-jia@liverpool.ac.uk

Study information

Scientific Title

Steroid Treatment Trial in JIA (STAR-JIA): A randomised trial to compare the effectiveness, safety and cost-effectiveness of intravenous versus oral corticosteroid induction regimens for children and young people with juvenile idiopathic arthritis

Acronym

STAR-JIA

Study objectives

Primary objectives:

To compare the clinical effectiveness of intravenous methylprednisolone versus oral prednisolone for controlling new-onset polyarticular juvenile idiopathic arthritis (JIA) in JIA Core Outcomes.

Secondary objectives:

- 1. To compare the differences in JIA Core Outcomes for intravenous methylprednisolone versus oral prednisolone for the following domains:
- 1.1. Pain
- 1.2. Function
- 1.3. Health-related Quality of Life (HRQOL)
- 2. To assess the effectiveness of intravenous versus oral corticosteroids in minimising the need for additional treatments including all corticosteroid routes and additional disease-modifying anti-rheumatic drugs (DMARDs)/biologics.
- 3. To evaluate short/medium-term safety and tolerability of IV versus oral corticosteroids, with regards to adverse reactions, serious adverse events, laboratory assessments and paediatric glucocorticoid toxicity index (pGTI).
- 4. To determine if a dose-response relationship can be identified in the efficacy/adverse responses to corticosteroids across all participants by secondary analysis, normalising corticosteroids received for dose, bioavailability and potency using previously published data.

Health condition(s) or problem(s) studied

Juvenile idiopathic arthritis (polyarticular)

Interventions

IMP: Intravenous methylprednisolone administered over 3 days on a hospital day unit Comparator: Oral prednisolone taken/administered over 6 weeks at home

The doses, frequency and method of administration of the IMP and comparator drug are provided below.

IMP: Methylprednisolone

Route: Intravenous administration

Form: Powder for injection to be prepared for intravenous administration 30 mg/kg per day for 3 consecutive days (Maximum dose: 1g per day)

Comparator: Prednisolone Route: Oral administration Form: Tablet or solution

The initial dose of prednisolone will be 1 mg/kg per day with a maximum dose of 40 mg. For participants weighing ≥40 kg, the weaning will be a reduction in line with the percentage decrease used for lighter patients.

Week of oral prednisolone 1: Dose (patient <40 kg): 1 mg/kg per day; Dose (patient ≥40 kg): 40 mg

Week of oral prednisolone 2: Dose (patient <40 kg): 0.75 mg/kg per day; Dose (patient ≥40 kg): 30 mg

Week of oral prednisolone 3: Dose (patient <40 kg): 0.5 mg/kg per day; Dose (patient ≥40 kg): 20 mg

Week of oral prednisolone 4: Dose (patient <40 kg): 0.375 mg/kg per day; Dose (patient ≥40 kg): 15 mg

Week of oral prednisolone 5: Dose (patient <40 kg): 0.25 mg/kg per day; Dose (patient ≥40 kg): 10 mg

Week of oral prednisolone 6: Dose (patient <40 kg): 0.125 mg/kg per day; Dose (patient ≥40 kg): 5 mg

Intervention Type

Drug

Pharmaceutical study type(s)

Pharmacokinetic, Pharmacodynamic, Bioequivalence, Pharmacoeconomic

Phase

Phase IV

Drug/device/biological/vaccine name(s)

Methylprednisolone, prednisolone

Primary outcome measure

Primary clinical outcome:

Disease activity measured using the JADAS10 score at 0 weeks (Baseline) and 6 weeks

Primary economic outcomes:

- 1. Incremental cost per quality-adjusted life year (QALY) gained measured using Resource Use Questionnaires and Patient Level Information and Costing System (PLICS) data at 0 weeks (Baseline), 6 weeks, 12 weeks, 24 weeks and 52 weeks.
- 2. Resource use, costs and health utilities associated with IV and oral corticosteroids measured using Resource Use Questionnaires and Patient Level Information and Costing System (PLICS) data at 0 weeks (Baseline), 6 weeks, 12 weeks, 24 weeks and 52 weeks.

Secondary outcome measures

- 1. Disease activity in subjects with polyarticular Juvenile Idiopathic Arthritis (JIA) randomised to IV methylprednisolone or oral prednisolone measured using the American College of Rheumatology (ACR) Pediatric Response Criteria (30, 50, 70, 90, 100) at 0 weeks (baseline), 6 weeks, 12 weeks, 24 weeks, 52 weeks.
- 2. Disease activity in subjects with polyarticular Juvenile Idiopathic Arthritis (JIA), randomised to IV methylprednisolone or oral prednisolone measured using the JADAS (10,27,71) at 0 weeks (baseline), 6 weeks, 12 weeks, 24 weeks, 52 weeks.
- 3. Disease activity in subjects with polyarticular Juvenile Idiopathic Arthritis (JIA) randomised to IV methylprednisolone or oral prednisolone measured by JADAS10 cut-off scores at 0 weeks (baseline), 6 weeks, 12 weeks, 24 weeks, 52 weeks.
- 4. Pain in subjects with polyarticular Juvenile Idiopathic Arthritis (JIA) randomised to IV methylprednisolone or oral prednisolone measured using the Pain Visual Analogue Scale (Pain VAS) at 0 weeks (baseline), 6 weeks, 12 weeks, 24 weeks, 52 weeks.
- 5. Function in subjects with polyarticular Juvenile Idiopathic Arthritis (JIA) randomised to IV methylprednisolone or oral prednisolone measured using the Childhood Health Assessment Questionnaire (CHAQ) at 0 weeks (baseline), 6 weeks, 12 weeks, 24 weeks, 52 weeks.
- 6. Health-related Quality of Life (HRQoL) in subjects with polyarticular Juvenile Idiopathic Arthritis (JIA) randomised to IV methylprednisolone or oral prednisolone measured using Child Health Utility 9D Questionnaire (CHU-9D) and CAPTURE-JIA PROM at 0 weeks (baseline), 6 weeks, 12 weeks, 24 weeks, 52 weeks.
- 7. Requirement for additional treatment for subjects with polyarticular Juvenile Idiopathic Arthritis (JIA) due to failure to respond to IV methylprednisolone or oral prednisolone measured using concomitant medications recorded at 6 weeks, 12 weeks, 24 weeks, 52 weeks.
- 8. Glucocorticoid toxicity in subjects with polyarticular Juvenile Idiopathic Arthritis (JIA) randomised to IV methylprednisolone or oral prednisolone measured using Paediatric Glucocorticoid Toxicity Index (pGTI) scores at 0 weeks (baseline), 6 weeks, 12 weeks, 24 weeks, 52 weeks

Overall study start date

13/07/2023

Completion date 06/02/2027

Eligibility

Key inclusion criteria

- 1. Participants must be between 1-18 years of age inclusive
- 2. New onset pcJIA diagnosed by a paediatric rheumatologist (to include polyarticular rheumatoid factor (RF+) positive, polyarticular RF negative, enthesitis-related arthritis, psoriatic arthritis and extended oligo-articular). This includes new diagnosis of JIA with at least 5 joints affected and patients previously categorised as oligoarticular JIA (with 4 joints or less) who have extended to at least 5 joints.
- 3. Participants are expected to be able to commence allocated treatment within 1 week of randomisation
- 4. Written, informed consent and where appropriate, assent obtained from participant or their legal representative
- 5. Participants of child-bearing potential must be willing to abstain from sexual intercourse from consent to their final visit and/or use another acceptable contraception method as described in section 9.10.5 of this protocol

Participant type(s)

Patient

Age group

Child

Lower age limit

1 Years

Upper age limit

18 Years

Sex

All

Target number of participants

130

Key exclusion criteria

- 1. Any contraindication to starting corticosteroids
- 2. Any contraindication to starting methotrexate
- 3. Pregnancy
- 4. Treatment with systemic corticosteroids within 4 weeks preceding screening (includes IV, IA, IM and oral)
- 5. Treatment with methotrexate within 12 weeks preceding screening
- 6. Any co-morbidity which in view of the treating clinician makes participation inappropriate

Results and Publications

Publication and dissemination plan

- 1. Peer-reviewed scientific journals
- 2. Conference presentation
- 3. Publication on website
- 4. Other publication
- 5. Submission to regulatory authorities

The results of STAR-JIA will be published regardless of the magnitude or direction of effect. After the primary results have been published, the anonymised individual participant data and associated documentation (protocol, statistical analysis plan, annotated blank CRF will be prepared in order to be shared with external researchers.

Dissemination animations will be created with input from PPIE group for both participants, families and the public as well as healthcare professionals to increase impact of the findings,

There is a JIA patient and public involvement focus group that contribute to development of study information sheets and animation videos for participants and parents/guardians, protocol and dissemination of results. Results of this research study will be shared with healthcare professionals, participants/care-givers and the public including medical conferences and online journals.

Intention to publish date

30/12/2027

Individual participant data (IPD) sharing plan

The current data sharing plans for this study are unknown and will be available at a later date.

IPD sharing plan summary

Data sharing statement to be made available at a later date
