Plain English summary of protocol

Background and study aims

Many people with depression would like to receive a 'talking treatment' (counselling or psychotherapy). The form of talking treatment that is supported by the greatest amount of evidence is Cognitive Behaviour Therapy (CBT). At the present time, there are too few therapists to treat people with depression. Recently, a form of CBT has been developed that can be delivered by computer. Computerised CBT can be delivered in the patient's own time (and potentially in their own home) and does not require waiting for a therapist. Several computer packages of CBT have been developed. Some of these are free to use and are available over the internet, whilst some are commercial products and have to be purchased at substantial cost to the NHS. We need more information about the effectiveness of these packages and we need to know whether the additional cost of purchasing commercially available products is a sensible use of limited NHS funds. As part of a study comparing two CBT packages with usual GP care, we wish to assess the clinical and cost effectiveness of the addition of regular telephone support to computerised CBT.

Who can participate?

Patients with depression, aged 18 and over

What does the study involve?

All participants receive usual GP care and computerised CBT (MoodGYM - a free-to use web-based CBT programme for depression). In addition participants are randomly allocated to receive either weekly telephone support calls or no telephone support calls. We examine whether this is effective at reducing the symptoms of depression over a 12-month follow-up period.

What are the possible benefits and risks of participating?

Not provided at time of registration

Where is the study run from?

University of York (UK)

When is the study starting and how long is it expected to run for?
January 2011 to May 2015

Who is funding the study?
NIHR Health Technology Assessment Programme - HTA (UK)

Who is the main contact?
Prof. Simon Gilbody
sg519@york.ac.uk

Study information

Scientific Title
Does the provision of telephone support enhance the effectiveness of therapy? A randomised controlled trial and economic evaluation

Acronym
REEACT-2

Study objectives

To establish the clinical and cost effectiveness of the addition of regular telephone support to computerised CBT over a four and 12 month follow-up period.

This trial is a sub-study of the REEACT trial. More details may be found at:

1. <http://www.isrctn.com/ISRCTN91947481>
2. <http://www.nets.nihr.ac.uk/projects/hta/064305>

Ethics approval required

Old ethics approval format

Ethics approval(s)

Bradford Research Ethics Committee, 20/12/2010, ref: 10/H1302/95

Study design

Randomised controlled multicentre study including concurrent economic evaluation

Primary study design

Interventional

Secondary study design

Randomised controlled trial

Health condition(s) or problem(s) studied

Depressive disorder

Interventions

Experimental intervention: Usual GP care PLUS computerised CBT (MoodGYM - a free-to use web-based CBT programme for depression) PLUS weekly telephone support calls.

Control intervention: Usual GP care PLUS computerised CBT (MoodGYM)

Intervention Type

Other

Phase

Not Applicable

Primary outcome measure

Depression severity and symptomatology (PHQ-9 ≥ 10), measured by a validated self-report measure (the Patient Health Questionnaire [PHQ-9]) depression score at four months.

Secondary outcome measures

Outcome measures as of 01/04/2016:

1. Self-reported depression severity, measured by the 9-item Patient Health Questionnaire (PHQ-9) at four and 12 months as a continuous measure
2. Anxiety, measured using the Generalised Anxiety Disorder Assessment (GAD-7) at 4 and 12 months
3. Somatoform complaints, measured using the Patient Health Questionnaire 15 (PHQ-15) at 4 and 12 months
4. Health state utility, measured using EuroQol (EQ5D) at 4 and 12 months

Original secondary outcome measures:

1. PHQ-9 measured at 12 months

And the following outcome measures at both 4 and 12 months:

2. Anxiety, measured using the Generalised Anxiety Disorder Assessment (GAD-7)
3. Somatoform complaints, measured using the Patient Health Questionnaire 15 (PHQ-15)
4. Health-related quality of life, measured using the Short-Form 12 (SF-12)
5. Health state utility, measured using EuroQol (EQ5D) at 4, 12 and 24 months

Overall study start date

04/01/2011

Completion date

31/05/2015

Eligibility

Key inclusion criteria

1. Adult patients, aged 18 years and above
2. Depression defined as a score of greater than or equal to 10 on the PHQ9 depression severity instrument
3. Not currently in receipt of computerised CBT or specialist psychological therapy
4. Patients may be with or without either co-morbid physical illness or co-morbid non-psychotic functional disorders, such as anxiety
5. Both incident and prevalent cases
6. In line with the pragmatic nature of this trial, we will reflect usual GP care and participants will be eligible to participate whether they are in receipt of antidepressant medication or not
7. Patients with previous treatment experience of CBT will not be excluded

Participant type(s)

Patient

Age group

Adult

Lower age limit

18 Years

Sex

Both

Target number of participants

350, 175 per study arm

Key exclusion criteria

1. Actively suicidal
2. Suffering psychotic symptoms
3. Depressed in the post-natal period
4. Have recently suffered bereavement
5. Cases of psychotic depression; since computerised therapy is not recommended within NICE guidance.
