Study information

Scientific Title

Classical versus Modern Local Wound Care in Surgical Patients: A Randomized Controlled Trial

Acronym

MOKUM trial

Study objectives

Occlusive, non-gauze based wound dressings are more effective (as to time to complete wound healing, pain during dressing changes, and costs) than non-occlusive, gauze-based dressings for local wound care.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Not provided at time of registration

Study design

Randomised controlled trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Wound Care

Interventions

Occlusive wound dressing materials versus gauze dressings

Intervention Type

Other

Phase

Not Specified

Primary outcome(s)

Time to complete wound healing

Key secondary outcome(s))

- 1. Pain during dressing changes
- 2. Material and nursing costs of dressing changes
- 3. Duration of hospitalisation
- 4. Adverse effects of dressings

Completion date

14/09/2005

Eligibility

Key inclusion criteria

- 1. Adult patients admitted to the departments of surgery with open wounds requiring local wound care
- 2. Written informed consent

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Sex

All

Total final enrolment

285

Key exclusion criteria

- 1. Burn and malignant wounds
- 2. Surgically closed wounds
- 3. Wounds treated with vacuum assisted closure (VAC) devices
- 4. Ostomies or drain openings
- 5. Pin holes from external fixation materials
- 6. Patients receiving chemotherapy or local irradiation therapy
- 7. Patients with a life expectancy <6 months

Date of first enrolment

23/04/2004

Date of final enrolment

14/09/2005
