Study information

Scientific Title

Study objectives

Current guidelines for the management of hypertension recommend regular, moderate intensity aerobic exercise such as brisk walking as a means of blood pressure reduction. However, there is a lack of consistent evidence regarding the magnitude of blood pressure response to such a prescription. In particular, no well designed studies have investigated the efficacy of a programme of exercise meeting current guidelines. AIM: To investigate the effect of a six-week programme of moderate intensity exercise on daytime ambulatory blood pressure (10.00 am to 10.00 pm) among unmedicated, sedentary adults aged 25 years to 63 years with office blood pressure of 150 mmHg to 180 mmHg systolic and/or 91 mmHg to 110 mmHg diastolic.

Participant information sheet

Health condition(s) or problem(s) studied

Cardiovascular diseases: Hypertension

Interventions

- 1. 30 minutes of moderate intensity exercise (brisk walking or equivalent) five days per week for six weeks
- 2. Maintenance of existing levels of physical activity

Intervention Type

Other

Phase

Not Specified

Primary outcome measure

Blood pressure

Secondary outcome measures

Overall study start date

01/06/1995

Completion date

31/12/1997

Eligibility

Key inclusion criteria

Sedentary adults aged 25 to 63 years with office blood pressure of 150 mmHg to 180 mmHg systolic and/or 91 mmHg to 110 mmHg diastolic

Participant type(s)

Patient

Age group

Adult

Lower age limit

18 Years

Sex
