Study information

Scientific Title

Acronym
MASOPA

Study objectives
Somatoform disorder with pain as a leading complaint (International Statistical Classification of Diseases and Related Health Problems - tenth revision [ICD10]: F45).

The study was designed to compare efficacy of psychodynamic and cognitive behavioural group psychotherapy in patients with somatoform pain. Therefore, a total of 150 patients are randomised to one of either therapies. Both therapies are manualized and supervisioned by video. Patients living more than one hour driving distance to the university hospital who cannot take part in out patient therapy serve as controls by receiving care as usual.

Study design
Randomised controlled trial

Primary study design
Interventional

Study type(s)
Treatment

Health condition(s) or problem(s) studied
Somatoform pain

Interventions
Patients receive out patient psychotherapy for 6 months. They were randomised into psychodynamic versus cognitive behavioural therapy. Therapy was manualized. Sessions took place twice a week and once a week respectively. The total amount of therapy was 3600 minutes in psychodynamic and 2750-3000 minutes cognitive behavioural therapy. Groups consist of 8-10 patients starting therapy together, they were closed for further participants.

Intervention Type
Other

Phase
Not Specified

Primary outcome(s)
Pain intensity and pain disability. Due to the chronic condition, a one year follow-up will service as the primary outcome.

Key secondary outcome(s))

Pain intensity and pain disability.

Completion date
30/11/2005

Eligibility

Key inclusion criteria
Patients were included if they had persistent pain (>6 months) without an adequate physical explanation after a broad multidisciplinary check and if they could understand German.

Patients were referred by their general practitioners or specialists in or outside the university hospital. A total of 150 patients will be randomised to one of either therapies, patients living more than one hour driving distance to the university hospital cannot take part in out patient therapy and will serve as controls by receiving treatment as usual (n = 70). Due to the chronic condition, a one year follow-up will serve as primary outcome. A two year follow-up is intended.

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Adult

Sex
Not Specified

Key exclusion criteria
Age <18 or >65, psychosis, severe substance dependency, missing understanding of German language, and a request to retire because of disease.
