Study information

Scientific Title
PATCH Trial: Post-tonsillectomy Analgesia with buprenorphine Transdermal patCH: a prospective, randomised, phase IV, open label clinical trial to study the therapeutic use of buprenorphine 20 mg (Transtec®) matrix transdermal patch in the management of post-tonsillectomy pain in adults

Acronym
PATCH Trial

Study objectives
To establish whether post-tonsillectomy analgesia using a transdermal patch has benefits over currently used oral analgesia, by comparatively measuring the clinical efficacy, the effective and perceived pain control, and the rate at which complications and adverse effects occur.

Ethics approval required
Old ethics approval format

Ethics approval(s)
North East Wales Research Ethics Committee (REC), 31/01/2008, ref: 07/WNo03/23

Study design
Randomised controlled trial

Primary study design
Interventional

Health condition(s) or problem(s) studied
Post-tonsillectomy pain

Interventions

Arm A (interventional): will receive a 12 day supply of buprenorphine 20 mg (35 mg/h) (Transtec®) matrix transdermal patches (a total of four patches). Patients are required to replace the transdermal patch every three days.

Arm B (control): will receive a 12-day supply of codeine phosphate 30 mg/ paracetamol 500 mg (30/500/Solpadol®). Patients are required to take two tablets every four hours (p.r.n).

Total duration of treatment is 12 days. Final assessment and all data collected at day 10 (outpatient clinic), for both arms, no other follow-up.

Please use the following contact details to request a patient information sheet:

Intervention Type
Drug

Phase
Phase IV

Drug/device/biological/vaccine name(s)
Buprenorphine (Transtec®), codeine phosphate hemihydrate, paracetamol (Solpadol®)

Primary outcome measure
1. Clinical efficacy: the buprenorphine : creatinine ratio
2. Perceived pain: measurements on the Visual Analogue Scale (VAS)
3. Coping strategies: the compounded prevalent strategy

All outcomes will be measured at day 10 of the intervention.

Secondary outcome measures
1. Use (dose/frequency) of rescue medication
2. Readmission rate
3. Post-operative haemorrhage rate

All outcomes will be measured at day 10 of the intervention.

Overall study start date
15/11/2007

Completion date
30/10/2009

Eligibility

Key inclusion criteria

Patients undergoing tonsillectomy, who meet the following criteria:
1. Aged 18 to 50 years old, either sex
2. American Society of Anaesthesiologists (ASA) grade I and II: healthy patient, mild systemic disease with no functional limitation (e.g., well controlled hypertension [HTA])

Participant type(s)
Patient

Age group
Adult

Lower age limit
18 Years

Sex
Both

Target number of participants
150 in each arm, 300 in total

Total final enrolment
133

Key exclusion criteria
1. Age less than 18 or over 50 years
2. ASA grade III - severe systemic disease with definite functional limitation (e.g., unstable angina)
3. Any condition in which the respiratory centre and function are severely impaired or may become so
4. Asthmatic and allergic to non-steroidal anti-inflammatory drugs (NSAIDS)
5. Hypotension
6. Pregnancy and lactation
7. Recent head injury
8. Known hypersensitivity towards the active substance buprenorphine or to any of the excipients
9. Opioid-dependent patients, or patients in narcotic withdrawal treatment
9. Patients who are receiving monoamine oxidase (MAO) inhibitors or have taken them within the last two weeks
10. Patients suffering from myasthenia gravis
11. Patients suffering from delirium tremens or acute alcohol intoxication
12. Convulsive disorders

Date of first enrolment
15/11/2007

Date of final enrolment
30/10/2009
