Study objectives

To determine the best method (mail or telephone) for family physicians offices to invite patients to attend a session, and to identify factors that predicted attendance. In preparation for a larger scale randomized controlled trial, we also performed a cost analysis of invitation method and success rate, investigated the operational and methodological aspects of the proposed intervention, and queried patients willingness to continue to attend community pharmacy blood pressure sessions and their preferences for the time and frequency of the sessions.

Study design

Randomised controlled trial

Primary study design

Interventional

Study type(s)

Diagnostic

Health condition(s) or problem(s) studied

Hypertension

Interventions

Regular patients 65 years or older (n = 235) were randomly allocated to invitation by mail or telephone to attend pharmacy cardiovascular health awareness sessions led by volunteer peer health educators.

Intervention Type

Other

Phase

Not Specified

Primary outcome(s)

The primary end-point was the overall attendance among patients invited by mail compared to those invited by telephone.

Key secondary outcome(s))

Not provided at time of registration

Completion date

27/04/2001

Eligibility

Key inclusion criteria

Patients were eligible to participate if they were 65 years of age or older, considered by the physician to be regular patients, community dwelling, and able to attend a cardiovascular health promotion session in a local pharmacy.

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group
