Study information

Scientific Title

Acronym

MISSION! Intervention Study

Study objectives

Thin strut cobalt chromium stents are not inferior in preventing restenosis compared to sirolimus-eluting stents in patients with acute myocardial infarction.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Received from local medical ethics committee

Study design

Randomised open label controlled parallel group trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Acute myocardial infarction

Interventions

The MISSION! Intervention Study is a prospective randomised study comparing non-coated, thin strut, cobalt chromium stents (Vision™) and sirolimus eluting stents (Cypher™) for the treatment of patients with acute myocardial infarction.

300 patients will be randomised and treated by primary percutaneous coronary intervention with stent implantation. All patients will have angiographic follow-up at 9 months to assess the primary endpoint with Quantitative Coronary Angiography. In all patients, IVUS will be performed post-intervention and at 9 months follow-up to assess acute and late incomplete stent apposition and neointimal volume.

Moreover fractional flow reserve will be measured at 9 months to assess functional stent patency. At 12 months major adverse events will be counted and analysed according to life table methods.

Clinical and angiographic data will be analyzed according to the principle of intention-to-treat and evaluable group analyses. End-point variables will be presented by means of 95% confidence intervals.

Intervention Type

Other

Phase

Not Specified

Primary outcome(s)

In-lesion late loss at 9 months

Key secondary outcome(s)

1. MACE (death, myocardial infarction, target vessel revascularisation, target lesion revascularisation) at 12 months
2. Incomplete stent apposition at 9 months
3. Minimal lumen area at 9 months
4. Fractional flow reserve at 9 months

Completion date

31/01/2006

Eligibility

Key inclusion criteria

1. Between 18 and 80 years of age
2. ECG evidence of an acute myocardial infarction
3. De novo native culprit lesion
4. Target vessel with a reference diameter between 2.25 and 3.75 mm
5. Target lesion length \leq 24 mm
6. Written informed consent

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Lower age limit

18 years

Sex

All

Key exclusion criteria

1. Rescue PTCA
2. Start symptoms >9 hours before the procedure
3. Left main lesion with \geq 50% diameter stenosis
4. Triple vessel disease
5. Involvement of a major side branch
6. Previous PCI or CABG of the culprit vessel
7. Renal insufficiency
8. Unwilling or unable to comply with the study requirements or follow-up evaluations
9. Contraindication for abciximab

- 10. Extensive peripheral vascular disease
- 11. Non-cardiac illness with a life expectancy less than 12 months

Date of first enrolment

01/02/2004

Date of final enrolment

31/01/2006
