# Study information

#### Scientific Title

#### **Study objectives**

To study the role of drains after thyroid surgery and monitor the fluid collection in thyroid bed.

#### Ethics approval required

Old ethics approval format

#### Ethics approval(s)

Not provided at time of registration

#### Study design

Randomised controlled parallel group trial

#### Primary study design

Interventional

#### Secondary study design

Randomised controlled trial

#### Study setting(s)

Hospital

#### Study type(s)

Treatment

#### Participant information sheet

## Health condition(s) or problem(s) studied

Thyroid disorders

#### Interventions

All patients included in the study were randomly allocated to drain and non-drain group on the basis of computer generated random number table. The surgeon was informed of the group just before the closure of the wound. In the drain group a closed suction drain with negative pressure (Romovac®) was brought out through a separate wound. Ultrasound of the neck using B mode with linear frequency of 7.5 MHz was performed in both groups between 24 to 48 hours of surgery and seventh postoperative day. Volume of fluid collection in the operative bed was calculated by measuring the maximum diameter in three dimensions. The volume of fluid collected in the suction drain was measured separately. The drains were removed in all the patients after 48 hours. All patients were observed for any postoperative respiratory distress, change in voice, wound collection, tingling sensation, tetany etc.

## Intervention Type

Procedure/Surgery

#### Phase

**Not Specified** 

#### Primary outcome measure

All patients were observed for any postoperative respiratory distress, change in voice, wound collection, tingling sensation, tetany etc. The specimens were subjected to histopathological examination for final confirmation of diagnosis. Using two sample t-test all the data was statistically analyzed for any significant difference in the two groups for:

- 1. Fluid collection in thyroid bed on day one and day seven
- 2. Size of nodule and amount of fluid collection
- 3. Complication rate

#### Secondary outcome measures

Not provided at time of registration

## Overall study start date

01/01/2001

#### Completion date

01/03/2002

# **Eligibility**

#### Key inclusion criteria

The study was carried out on 94 patients who underwent thyroid surgeries in a single unit. Patients with cervical lymph nodes metastases requiring neck dissection and those with clinical or laboratory indicators of coagulation disorders were excluded from the study. No patient was excluded on the basis of size of the gland, difficulty in surgery, surgery involving both lobes and re-operation in the neck.

#### Participant type(s)

Patient

#### Age group

Not Specified

#### Sex

**Not Specified** 

## Target number of participants

94

#### Key exclusion criteria

Does not match inclusion criteria

#### Date of first enrolment

01/01/2001

#### Date of final enrolment

01/03/2002
