# Study information

#### Scientific Title

Prospective randomised controlled double-blind trial of shock wave therapy (SWT) vs observation only (sham therapy) for Peyronie's disease

#### Study objectives

To confirm the question of efficacy of shock wave therapy (SWT) in patients randomised to the treatment arm and assess whether an active treatment such a SWT leads to statistically significant improvement in these patients compared to that achieved by natural resolution.

On 19/08/2008 the following changes were made to the trial record:

- 1. The public trial title was changed from "Prospective Randomised Trial of Shock Wave Therapy vs Conservative Management of Peyronie's Disease" to "Shock wave therapy (SWT) vs observation only (sham therapy) for Peyronie's disease".
- 2. The scientific title was added.
- 3. The anticipated start date was changed from 01/04/2004 to 01/01/2005.
- 4. The anticipated end date was changed from 31/03/2006 to 12/12/2006.
- 5. The sources of funding field was updated.

#### Previous sources of funding:

- 1. East Norfolk and Waveney Research Consortium Norfolk and Norwich University Hospital /Norwich PCT
- 2. NHS R&D Support Funding

#### Ethics approval required

Old ethics approval format

#### Ethics approval(s)

Norfolk Research and Ethics Committee, 19/08/2004, ref: 04/Q0101/46

#### Study design

Double-blind randomised controlled trial

#### Primary study design

Interventional

## Study type(s)

Treatment

## Health condition(s) or problem(s) studied

Peyronie's disease

#### Interventions

Six sessions of SWT over a period of 6 weeks at a rate of one session per week vs observation only (sham therapy).

### Intervention Type

Other

#### Phase

Not Applicable

#### Primary outcome(s)

Current primary outcome measures as of 19/08/2008:

- 1. Mean change in angle of deformity for each arm of the study
- 2. Difference in mean change in angle between treatment and non-treatment arm

3. Difference in the mean International Index of Erectile Function (IIEF) scores pre and post treatment in each group

All primary and secondary outcomes were measured at 6 months post-therapy.

Previous primary outcome measure: Reduction in the angle of penile deformity

#### Key secondary outcome(s))

Current secondary outcome measures as of 19/08/2008:

The difference in pain scores measured by a visual analogue scale (VAS) and Global Assessment Questionnaire (GAQ) scores between two groups

All primary and secondary outcomes were measured at 6 months post-therapy.

Previous secondary outcome measures:

Improvement in pain scores (VAS) and erectile function scores (IIEF) and partner satisfaction

#### Completion date

12/12/2006

# **Eligibility**

#### Key inclusion criteria

Current inclusion criteria as of 19/08/2008:

- 1. Penile deformity secondary to Peyronie's disease affecting ability to perform sexual intercourse and/or quality of life due to penile angulation
- 2. Age >18

Previous inclusion criteria:

- 1. 40-60 in each arm
- 2. Patients with suspected Peyronie's disease

#### Participant type(s)

**Patient** 

#### Healthy volunteers allowed

No

#### Age group

Adult

#### Lower age limit

18 years

#### Sex

Male

#### Key exclusion criteria

Current exclusion criteria as of 19/08/2008:

- 1. Congenital curvature of the penis
- 2. Previous treatment for Peyronie's disease
- 3. Patients on warfarin

Previous exclusion criteria:

- 1. Patients on warfarin
- 2. Patients with total erectile dysfunction (ED)

Date of first enrolment

01/01/2005

Date of final enrolment

12/12/2006
