Health condition(s) or problem(s) studied

Depression

Interventions

The 66 participants will be divided into 3 groups (22 participants each), and then they will be randomly allocated to the intervention and control sub-groups (therefore, each sub-group consists of 11 participants). The control group will be provided with antidepressants and another will be provided with a psychosocial intervention.

Psychosocial intervention: The group structure will be informal, active participation by the women will be encouraged at all times. The facilitators will motivate and encourage these women. The overall aim would be to provide social support, stimulation, education on mental and physical health needs, problem solving training and possibly giving these women a break from their distressing environment. This will provide an opportunity for them to initiate a process of getting acquainted with other women, even making friends. We hope that some of

these relationships would be long lasting and would continue even when the group ends. Total number of sessions: 10. Duration of each session is 1 hour.

Total duration of interventions: 12 weeks.

Intervention Type

Other

Phase

Not Specified

Primary outcome measure

The following will be carried out before and after attendance at the social activities group for 10 sessions or taking antidepressants for 10 weeks:

1. Self Rating Questionnaire (SRQ)
2. Hamilton depression scale

Secondary outcome measures

Quality of life, assessed by EuroQol (EQ-5D) at 12 weeks.

Overall study start date
