# Study information

Scientific Title

Influence of increasing intakes of eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) on vascular function and risk factors for cardiovascular disease

#### Acronym

**MARINA** 

#### **Study objectives**

Increasing the intake of eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA) will have favourable effects on heart-rate variability, endothelial function, arterial stiffness, blood pressure and these effects will be dose-related.

#### Ethics approval required

Old ethics approval format

#### Ethics approval(s)

St. Thomas' Hospital Research Ethics Committee, 25/02/2008, ref: 08/H0802/3

#### Study design

Parallel design, double-blind placebo controlled trial

#### Primary study design

Interventional

#### Study type(s)

Treatment

#### Health condition(s) or problem(s) studied

Cardiovascular disease

#### **Interventions**

This is a dietary intervention involving supplementation with encapsulated (n-3) polyunsaturated fatty acids, eicosapentaenoic acid (EPA) and docosahexaenoic acid (DHA), at three different doses (0.45, 0.9 and 1.8 g/d), compared with olive oil (BP specification) placebo. The duration of the intervention is 13 months. One month run-in on placebo and 12 months on one of four treatments.

#### **Intervention Type**

Drug

#### Phase

Not Applicable

#### Drug/device/biological/vaccine name(s)

Eicosapentaenoic acid (EPA), docosahexaenoic acid (DHA), polyunsaturated fatty acids

#### Primary outcome(s)

A change in endothelial function measured by the flow-mediated dilatation technique and ambulatory blood pressure, measured at baseline and 12 months.

#### Key secondary outcome(s))

- 1. Heart rate variability, measured at baseline, 6 months and 12 months
- 2. Arterial stiffness, measured at baseline and 12 months
- 3. Endothelial progenitor cell number, measured at baseline, 6 months and 12 months
- 4. Serum lipids, measured at baseline, 6 months and 12 months
- 5. C-reactive protein, measured at baseline, 6 months and 12 months

#### Completion date

31/12/2010

## Eligibility

#### Key inclusion criteria

Men and women, aged 45 - 70 years

#### Participant type(s)

Patient

#### Healthy volunteers allowed

No

#### Age group

Adult

#### Sex

All

#### Key exclusion criteria

- 1. A reported history of angina, myocardial infarction or stroke
- 2. Clinical history of cancer (excluding basal cell carcinoma) in the past five years
- 3. Uncontrolled type 2 diabetes mellitus (fasting plasma glucose greater than 7 mmol/L)
- 4. Type 1 diabetes mellitus
- 5. Chronic renal, liver or inflammatory bowel disease
- 6. Current cigarette smoker
- 7. History of substance abuse or alcoholism (previous weekly alcohol intake greater than 60 units/men or 50 units/women)
- 8. Current self-reported weekly alcohol intake not exceeding 21 units for women and 28 for men
- 9. Currently pregnant, planning pregnancy or having had a baby in the last 12 months (there are no hazards from the EPA or DHA with regard to pregnancy outcome)
- 10. Allergy or intolerance to any component of study capsules
- 11. Unwilling to follow the protocol and/or give informed consent
- 12. Unwilling to refrain from use of dietary supplements including other sources of fish oil (e.g. cod liver oil)
- 13. Unwilling to restrict consumption of oily fish
- 14. Weight change of greater than 3 kg in preceding 2 months
- 15. Body mass index less than 20 and greater than 35 kg/m^2
- 16. Subjects with an overall risk of cardiovascular disease over the next ten years of greater than 20% who have untreated high blood pressure or raised cholesterol (subjects who are on stable medication for blood pressure or serum cholesterol [statins] will be included)

#### Date of first enrolment

# Date of final enrolment 31/12/2010
