Study information

Scientific Title

Study objectives

In the UK most orthodontic treatment is carried out using fixed appliances or 'braces'. The first phase of fixed appliance orthodontic treatment is concerned principally with tooth alignment. Conventional fixed orthodontic brackets are cemented onto the teeth and attached to an arch wire using elastic ligatures. The teeth are then aligned using forces generated by the arch wire itself. Recently a ligature-free bracket system has been introduced. It has been suggested that reduced friction associated with this system can provide considerable benefits to the patient, principally because the teeth align more rapidly. We propose to investigate the nature of alignment of two fixed orthodontic bracket systems: Smart-Clip self ligating andOrmco Synthesis conventional siamese.

Participant information sheet

Health condition(s) or problem(s) studied

Oral Health: Orthodontics

Interventions

Smart-Clip® ligature free brackets vs conventional pre-adjusted edgewise brackets (3M Unitek).

Intervention Type

Other

Phase

Not Specified

Primary outcome measure

The ability of two fixed appliance orthodontic bracket systems to align crowded lower incisors. In particular lower incisor inclination and arch form changes will be compared.

Null hypothesis: there is no difference in lower incisor inclination, and angulation, and lower arch dimensions using self-ligating and conventional pre-adjusted edgewise brackets.

Secondary outcome measures

No secondary outcome measures

Overall study start date

22/09/2006

Completion date

21/05/2007

Eligibility

Key inclusion criteria

1. Patients should be fit and well and not currently on any medication or suffering from any craniofacial syndrome. Medication could theoretically affect the connective tissues that remodel during orthodontic treatment
2. Children under 18 years
3. Lower incisor tooth crowding of up to 5mm as part of their malocclusion
4. A requirement for fixed orthodontic treatment on a non-extraction basis
5. More severely crowded dentitions often require the loss of premolar teeth to provide the necessary space for alignment of the dental arch

Participant type(s)

Patient

Age group

Child

Upper age limit

18 Years

Sex

Not Specified

Target number of participants

20

Key exclusion criteria

1. A complete overbite. Complete overbite might be expected to reduce rates of tooth alignment due to bracket interferences.
2. No incisor teeth completely excluded from the dental arch

Date of first enrolment

22/09/2006

Date of final enrolment

21/05/2007
