Study information

Scientific Title

The effects of 16 weeks high load strength training and protein intake in patients undergoing dialysis: a prospective randomised controlled trial

Study objectives

Strength training and protein intake increase muscle strength more than strength training alone in patients undergoing dialysis

Ethics approval required

Old ethics approval format

Ethics approval(s)

Scientific committee, Region Hovedstaden, Denmark approved on 7th April 2009 (Number: H-D-2008-124)

Study design

Prospective randomised controlled trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Uremic myopathy in end-stage renal disease patients undergoing dialysis

Interventions

Exercise and intake of protein or non-protein energy:

Strength training for lower limbs three times per week in 16 weeks (48 sessions). The patients were randomised to exercise and a protein intake after each exercise session or exercise and a isocaloric non-protein intake.

Intervention Type

Other

Phase

Not Applicable

Primary outcome(s)

- 1. Muscle strength (equipment: Good Strength)
- 2. Muscle power (equipment: Power Rig)
- 3. Physical function (Chair stand test from The Senior Fitness Test)
- 4. Selfrated health (Short Form 36 questionaire)
- 5. Muscle size and type (muscle biopsy from the vastus lateralis muscle)
- 6. Electromyography (EMG) (surface from the vastus lateralis muscle)
- 7. Anabolic hormones (blood tests)
- 8. Insulin resistance (the oral glucose tolerence test)

All tests are done three times: A pretest 16 weeks before the baseline test with no intervention in between and a final retest after the 16 weeks of intervention

Key secondary outcome(s))

- 1. Physical activity
- 2. Food intake
- 3. Body weight
- 4. Kidney function

All tests are done three times: A pretest 16 weeks before the baseline test with no intervention in between and a final retest after the 16 weeks of intervention

Completion date

31/12/2011

Eligibility

Key inclusion criteria

- 1. Age above 18 years
- 2. Dialysis more than three months
- 3. Able to do strength training
- 4. Able to talk and read Danish

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Lower age limit

18 years

Sex

All

Key exclusion criteria

- 1. Blindness
- 2. Lower limb amputation
- 3. Diabetic retinopathy
- 4. Anticoagulation treatment by Fondaparinux (Arixtra®)
- 5. Mental reduction

Date of first enrolment

15/04/2009

Date of final enrolment

31/12/2011
