Study information

Scientific Title

Baby Skin Care Research Programme: a randomised, assessor-blinded controlled trial comparing an infant skin-cleansing product with water

Study objectives

Ammended 12/01/10:

Bathing healthy term babies using a baby wash product in the first 2 weeks following birth is not inferior to bathing babies using water alone.

Initial information at time of registration:

Infant skin cleansing with a product is superior to bathing with water only.

Please note that as of 12/01/10 this record has been updated. All updates can be found in the relevant field with the above update date. Please also note that the anticipated end date of this trial has been extended from 01/03/10 to 01/09/10, and that all outcomes will now be measured at 2 and 4 weeks, not 4 and 8.

Health condition(s) or problem(s) studied

Atopic eczema/ atopic dermatitis

Interventions

Babies will be randomised to be bathed in water only or bathe with the new baby wash product. All participating mothers will be given a demonstration bath by a health care assistant who has

been instructed on the appropriate advice. Women will be given written instructions to take home. The intervention will last from birth until 8 weeks of age.

The babies will be stratified according to risk of atopic eczema for analyses.

Intervention Type

Other

Phase

Not Applicable

Primary outcome measure

Rate of change in trans-epidermal water loss (TEWL) measurement from the first bath until day 56 after birth. TEWL is defined as the flux of condensed water diffusing through the skin.

(Added 12/01/10):

Average of the TEWL measurements over three sites (arm, leg and abdomen) will be calculated.

Follow up will take place at 2 and 4 weeks following birth. This will include assessment of all primary and secondary outcome measures.

Secondary outcome measures

1. Acceptability of intervention The views of mothers and significant others on smell, perception of cleanliness, perception of skin's moisture, measured using a specifically designed questionnaire and diaries which have gained content validity by being informed by the earlier qualitative work
2. Skin surface pH
3. Measurement of hydration
4. Change in clinical observations (erythema, dryness and scaling, need for medical products/attention)

Follow up will take place at 2 and 4 weeks following birth. This will include assessment of all primary and secondary outcome measures.

Overall study start date

09/03/2009

Completion date

01/09/2010

Eligibility

Key inclusion criteria

1. Screening phase:
 - 1.1. Women carrying singleton pregnancies who are booked to give birth at the study hospital
2. Trial phase:
 - 2.1. Babies (both males and females) born between 37 weeks and 41 weeks
 - 2.2. In good general health (as determined by the investigator)

Participant type(s)

Patient

Age group

Neonate

Sex

Both

Target number of participants

280 (added 12/01/10)

Key exclusion criteria**1. Screening phase:**

1.1. Women known to be carrying a baby with a chromosomal abnormality or other syndromic diagnosis

1.2. Women known to be having their baby adopted

2. Trial phase:

2.1. Admission to the neonatal unit

2.2. Phototherapy

2.3. Limb defects

2.4. Non-traumatic impairment of epidermal integrity, evidence of skin disorder at first visit. For the purposes of this study the following normal variations will not be considered skin disorders erythema neonatorum / erythema toxicum

2.5. Milia

2.6. Maternal age <18

Date of first enrolment

09/03/2009

Date of final enrolment

01/09/2010
