### Secondary identifying numbers

N/A

# Study information

#### Scientific Title

Randomised controlled trial of the effect of tilt table therapy with versus without an integrated stepping device on the level of consciousness of patients in persistent vegetative or minimally conscious state

### **Study objectives**

Tilt table therapy with an integrated stepping device is more effective in improving the level of consciousness than traditional tilt table therapy.

### Ethics approval required

Old ethics approval format

#### Ethics approval(s)

Local ethics committee (Ethikkommission der bayerischen Landesärztekammer), 30/05/2006, registration number: 06018

#### Study design

Randomised single-blind controlled trial

## Primary study design

Interventional

## Secondary study design

Randomised controlled trial

## Study setting(s)

Hospital

## Study type(s)

Treatment

### Participant information sheet

Not available in web format, please use contact details to request a participant information sheet

## Health condition(s) or problem(s) studied

Persistent vegetative or minimally conscious state

#### Interventions

Tilt table therapy with or without an integrated stepping device for three weeks

## Intervention Type

Device

#### Phase

**Not Specified** 

#### Primary outcome measure

Level of consciousness measured by the Coma Recovery Scale - revised after three weeks of treatment and three weeks follow-up

#### Secondary outcome measures

- 1. Improvement in heart rate variability
- 2. To assess muscle tone/spasticity (modified Tardieu scale/Asworth scale)
- 3. To monitor reaction of blood pressure, heart rate and oxygen saturation during treatments
- 4. To assess Glasgow Outcome Score at discharge from hospital

#### Overall study start date

23/06/2006

#### Completion date

31/12/2008

# Eligibility

### Key inclusion criteria

- 1. In a persistent vegetative or minimally conscious state after traumatic brain injury, intracerebral hemorrhage or ischemic stroke, or in a minimally conscious state after hypoxia
- 2. Aged 18 to 70 years
- 3. Time since injury not more than six months
- 4. Not yet mobilised into standing for more than 30 minutes
- 5. Informed consent of legal proxy

## Participant type(s)

**Patient** 

## Age group

Adult

## Lower age limit

18 Years

#### Sex

Both

## Target number of participants

50

#### Key exclusion criteria

- 1. Acute severe heart or lung disease (e.g. pneumonia, heart attack during the last four weeks)
- 2. Cardiac pace maker
- 3. Severe osteoporosis

- 4. Contractures or severe spasticity of lower extremities
- 5. Pregnancy
- 6. Unstable fractures or decubiti on lower extremities

#### Date of first enrolment

23/06/2006

#### Date of final enrolment

31/12/2008
