Study information

Scientific Title

Study objectives

The central hypothesis is that a combination of nortriptyline and gabapentin has a superior therapeutic profile than that of either drug alone.

Ethics approval required
Old ethics approval format

Ethics approval(s)
This trial has been review and approved by the Queen's University Research Ethics Board.

Study design
Randomised controlled trial

Primary study design
Interventional

Study type(s)
Treatment

Health condition(s) or problem(s) studied
Neuropathic pain

Interventions
Oral administration of:
1. Gabapentin
2. Nortriptyline
3. A gabapentin-nortriptyline combination

The end date of this trial is still being discussed, the anticipated end date entered above is an arbitrary date entered as one year after the trial started.

Intervention Type
Drug

Phase
Not Specified

Drug/device/biological/vaccine name(s)
Gabapentin, nortriptylin

Primary outcome(s)
The primary outcome measure of this study will be the mean daily pain intensity from the last seven days, at maximal tolerated dose, of each treatment period.

Key secondary outcome(s))
Secondary outcome measures will include frequency and severity of treatment-emergent adverse effects, global pain relief ratings, the short form McGill Pain Questionnaire, a pain interference questionnaire (Brief Pain Inventory), consumption of rescue medication (number of acetaminophen 325 mg tablets), a blinding questionnaire, two mood questionnaires (Beck Depression Inventory and Profile of Mood States) and a quality of life survey (SF-36).

Completion date

01/11/2005

Eligibility

Key inclusion criteria
1. Diabetic patients of either sex
2. 18 to 89 years of age
3. Distal, symmetric, sensory polyneuropathy

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Adult

Lower age limit
18 years

Sex
All

Key exclusion criteria
1. Neuropathy attributable to an etiology other than diabetes (e.g. hypothyroidism, vitamin B12 deficiency, connective tissue disease, amyloidosis and toxic exposure)
2. Presence of a painful condition as severe as, but distinct from, their diabetic neuropathy pain
3. Pregnancy or lactation
4. End-stage kidney or liver disease
5. Moderate to severe heart disease (Myocardial Infarction [MI] within preceding year, unstable angina, cardiac conduction defect or congestive heart failure)
6. Cardiovascular autonomic neuropathy
7. Postural hypotension more than 20 mmHg on initial assessment
8. Baseline mild to severe sedation or ataxia due to required concomitant drugs, or any other cause
9. Males with urinary symptoms attributable to benign prostatic hypertrophy
10. Presence of a seizure disorder
11. Angle-closure glaucoma
12. Ongoing administration of Monoamine Oxidase (MAO) inhibitors and/or a serious psychiatric disorder as diagnosed by a psychiatrist
13. Ongoing administration of anticonvulsants which induce cytochrome P450 enzymes (e.g. carbamazepine, oxcarbazepine)
14. Hypersensitivity to any of the study medications
15. History of significant abuse of illicit drugs, prescription drugs or alcohol
16. Lack of a primary physician
17. Patients who live alone and cannot assure daily contact with a friend, family member or caregiver

Date of first enrolment

01/11/2004

Date of final enrolment
01/11/2005

Locations

Countries of recruitment
Canada

Study participating centre
Queen's University
Kingston, ON
