Study information

Scientific Title

A multicentre randomised controlled trial of mild hypothermia for the prevention of intracranial hypertension in acute liver failure

Study objectives

The aim of this study is to establish what temperature is of greatest benefit to patients in preventing the development of cerebral oedema (CO).

Ethics approval required

Old ethics approval format

Ethics approval(s)

Not provided at time of registration

Study design

Multi-centre randomised controlled trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Digestive System: Acute liver failure (ALF)

Interventions

Randomised controlled trial

Intervention Type

Other

Phase

Not Specified

Primary outcome(s)

Onset of ICH, development of a sustained rise of ICP (>5 minutes of ICP > 25 mmHb)

Key secondary outcome(s)

Not provided at time of registration

Completion date

01/11/2006

Eligibility**Key inclusion criteria**

Not provided at time of registration

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Sex

Not Specified

Key exclusion criteria

Not provided at time of registration

Date of first enrolment

01/05/2005

Date of final enrolment

01/11/2006
