Study information

Scientific Title

An investigation into the merits of using a computer in the clinical assessment of children

Study objectives

The project aims to assess the merits of an established computer-assisted interview for children, the MacInterview, developed by Calam et al. (2000). The MacInterview will be compared with an equivalent paper-based interview, with particular focus on the child's engagement with the interview, the amount of information derived, the time-efficiency of the procedure, and the child's enjoyment of the procedure.

Participant information sheet

Health condition(s) or problem(s) studied

Mental and Behavioural Disorders: child psychology

Interventions

A. MacInterview

B. Interview using equivalent material presented in a paper-based format

The study will use an experimental (between-subjects) design involving two groups of children. One group will receive the MacInterview, the other will receive an interview using equivalent material presented in a paper-based format. Allocation to the groups will be randomised.

Each child will be interviewed on one occasion for approximately 45 minutes. The interview format will involve the child in activities including:

1. Choosing an image to represent her-/himself from a range of outline drawings of children of different sizes and ethnic origins

2. Choosing drawings to represent home and school settings which s/he has experienced and people connected with those settings
3. Working with outline faces depicting different emotional expressions (happy, sad, worried, etc)
4. Selecting representations of particular people s/he associates with particular emotions in each setting

All interviews will be video-taped to enable data to be obtained from subsequent analysis of the tapes by the researcher.

Intervention Type

Other

Phase

Not Specified

Primary outcome measure

Comparison in each interview format of:

1. The number and length (word count) of the child's verbal utterances
2. The amount of time spent "on task", as opposed to attending to external distractions
3. The amount of "standard" information obtained (i.e. information provided in answering the interview questions)
4. The amount of "additional" information obtained (i.e. information volunteered by the child over and above that given in response to the interview questions)
5. The amount of "emotion-focused" information obtained (i.e. information relating to the child's feelings or emotional states)
6. The amount of time required to complete the procedure
7. The child's rating of his/her enjoyment of the interview

Secondary outcome measures

Overall study start date

04/11/2002

Completion date

04/11/2003

Eligibility

Key inclusion criteria

Children aged between seven and 11 years (inclusive) referred to the Child and Adolescent Psychology Department, Carol Kendrick Unit, Withington Hospital, Nell Lane, West Didsbury, Manchester.

Participant type(s)

Patient

Age group

Child

Lower age limit
