Study information

Scientific Title

Study objectives

Is topical diclofenac more effective than bupivicaine in the treatment of post-operative wound pain at donor site

Ethics approval required

Old ethics approval format

Ethics approval(s)

Not provided at time of registration

Study design

Randomised controlled trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Post operative pain

Interventions

Randomised, controlled preliminary study. Patients will act as own control as two separate donor strips will be harvested from different dermatomal distribution.

Intervention Type

Other

Phase

Not Specified

Primary outcome(s)

Pain at donor site will be assessed using a visual analogue (VA) scale at 1, 2, 6, 8, 24, 48 and 72 hours post-operatively. Degree of healing will be assessed at dressing changes.

Key secondary outcome(s))

Not provided at time of registration

Completion date

30/03/2005

Eligibility

Key inclusion criteria

Patients over 18 years requiring a split autograft under general anaesthetic

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Lower age limit

18 years

Sex

All

Key exclusion criteria

Does not match inclusion criteria

Date of first enrolment

30/03/2004

Date of final enrolment

30/03/2005
