Study information

Scientific Title

The effectiveness of manipulation therapy on joint mobility in the diabetic foot

Study objectives

To investigate the effectiveness of manipulation therapy in improving joint mobility in the diabetic foot; to determine the range of motion at the first metatarso-phalangeal joint and ankle joint before and after manipulation therapy; to determine plantar foot pressures before and after manipulation therapy.

Ethics approval required

Old ethics approval format

Study design

Randomised controlled trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

Nutritional, metabolic and endocrine diseases: Diabetic foot ulcer

Interventions

Patients randomised to both the study and control groups will have the range of motion at the 1st metatarso-phalangeal and ankle joint measured.

The study group will then have the manipulation therapy.

In the control group, patients will have joint mobility and foot pressure measurements at 6 weeks apart, with option for manipulation therapy after completion of the study.

Intervention Type

Other

Phase

Not Specified

Primary outcome(s)

Change in joint mobility at first metatarso-phalangeal and ankle joint after manipulation treatment.

Key secondary outcome(s))

Not provided at time of registration

Completion date

01/04/2004

Eligibility

Key inclusion criteria

12 patients (attending the MFH, MDC, DSC and community podiatry clinics) with a positive prayer sign, neuropathy disability score of >6, presence of at least one foot pulse.
