Study information

Scientific Title

Study objectives
The objective has been to establish whether, in patients with acute malaria who cannot take medication by mouth, rectal artesunate plus referral differs from rectal placebo plus referral in terms of death or permanent disability.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Ethics approval received on the 1st January 1999.

Study design
Randomised controlled trial

Primary study design
Interventional

Secondary study design
Randomised controlled trial

Study setting(s)
Not specified

Study type(s)
Treatment

Participant information sheet

Health condition(s) or problem(s) studied
Malaria

Interventions
The sample size determination in the protocol specified that a total of 10,000 non per os patients would need to be randomised in order to detect a reduction of mortality from 5% to 3%.

Individual patients will be randomised to receive either AS suppository (intervention group) or placebo (comparator group). Patients in both groups will then be referred immediately to the nearest hospital/health centre.

Intervention Type
Drug

Phase
Not Specified

Drug/device/biological/vaccine name(s)
Artesunate (AS)

Primary outcome measure
1. Number of relevant deaths in the intervention and control arm assessed 7 - 30 days after enrolment (relevant defined as malaria positive patients in whom the death was probably /definitely preventable by the intervention)
2. Number of individuals with serious neurological disability in the intervention and control arms assessed at 7 - 30 days following enrolment in the study. Neurological disability defined as the development of new problems with feeding, walking, talking, sitting, sight, hearing, playing, balance and behaviour

Secondary outcome measures
1. Number of deaths in the intervention and control arm assessed 7 - 30 days following enrolment in the study
2. Number of cases of neurological disability in the intervention and control arms assessed at 7 - 30 days following enrolment in the study
3. Number of cases of neurological disability in malaria smear positive patients in the intervention and control arms assessed at 7 - 30 days following enrolment in the study
4. Number of cases of neurological disability in children in the intervention and control arms assessed at 7 - 30 days following enrolment in the study
5. Number of cases of neurological disability in pregnant women in the intervention and control arms assessed at 7 - 30 days following enrolment in the study
6. Number of deaths and neurological sequelae in the intervention and control arm in malaria smear positive patients who survived at least 8 hours but died before 7 days after enrolment in the study

Overall study start date
01/01/1999

Completion date
01/01/2001

Eligibility

Key inclusion criteria
1. Non per os children presenting to a peripheral health unit or traditional healer with clinicallly suspected P. falciparum malaria
2. Children (apparent age 6 months to 71 months) with suspected malaria who are too ill to take drugs by mouth
3. Individual informed consent - consent must have been given (generally by thumb-print) by the patient or guardian of the sick person
4. Community informed consent - at the start of the study in that area, community consent to the project would have been obtained

Participant type(s)
Patient

Age group
Child

Lower age limit
6 Months

Upper age limit
71 Months

Sex
Not Specified

Target number of participants
In this trial, it is not the number of patients recruited but the number of deaths that determine the statistical power of such a trial.

Key exclusion criteria
Ability to take an oral medication.

Date of first enrolment
01/01/1999

Date of final enrolment
01/01/2001
