Study information

Scientific Title

Acronym
PROCOLD

Study objectives
This study aimed to evaluate the outcome of acute exacerbations of COPD (AECOPD) comparing a standard with a procalcitonin (PCT)-guided antibiotic approach.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Not provided at time of registration

Study design
Randomised controlled trial

Primary study design
Interventional

Study type(s)
Treatment

Health condition(s) or problem(s) studied
Acute exacerbations of chronic obstructive pulmonary disease (COPD)

Interventions
At presentation patients will be randomly assigned to the procalcitonin-guided therapy group or to the standard-group. In the ProCT-group, antibiotic therapy will be discouraged (ProCT less than 0.1 ng/ml) or encouraged (ProCT greater than 0.25 ng/ml) based on ProCT levels. In the standard group therapy will be left to the discretion of the treating physician. A standardised work-up including C-reactive protein (CRP), white blood cell count (WBC), sputum /bronchoalveolar lavage (BAL) bacteriology, viral serology, blood cultures, spirometry, chest x-ray and clinical parameters will be undertaken. After 6 months, all patients will be re-evaluated in regard to clinical and laboratory parameters, spirometry and number of AECOPD.

Intervention Type
Other

Phase
Not Specified

Primary outcome(s)
Antibiotic use (% of patients).

Key secondary outcome(s))
1. Measures of laboratory and clinical outcome, i.e., serum ProCT and plasma C-reactive protein levels, leukocyte counts, temperature, oxygen saturation, respiratory rate, pulse rate, blood

pressure, quality of life indices, length of hospitalisation, complications during the course of disease until follow-up in 14 - 21 days (i.e. need for intensive care unit [ICU] stay, death)
2. Recurrence of exacerbation within 6 months after inclusion in the study including hospitalisation, antibiotics and oral steroids need

Completion date
31/05/2005

Eligibility

Key inclusion criteria
Patients presenting an acute exacerbation of COPD requiring medical therapy in the emergency station of a university hospital in Switzerland.

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Adult

Sex
All

Key exclusion criteria
Immunosuppression.

Date of first enrolment
23/11/2003

Date of final enrolment
31/05/2005
