Study information

Scientific Title

Acronym

TWT - Toddlers Without Tears

Study objectives

Preschool child externalising behaviour problems including aggression, opposition and hyperactivity.

- 1. At age 18 months:
- 1.1. Decreased incidence of externalising behaviours
- 1.2. Decreased prevalence of harsh and abusive parenting
- 1.3. Increased prevalence of warm and developmentally appropriate parenting
- 1.4. Decreased prevalence of maternal depression/anxiety
- 2. At age 24 months:
- 2.1. Sustained improvement in child behaviour, parenting and maternal wellbeing
- 3. An increase in knowledge, competency and confidence of Maternal and Child Health nurses in delivering anticipatory guidance for behaviour problems in young toddlers

Interventions

Cluster randomised controlled trial, cluster at the level of the well-child centre. Masking occurred at randomisation, with group allocation concealed from researchers and participants until allocation was complete.

Arm A: Parenting program (one individual 15-minute and two 2-hour group sessions) about normal child development, ways to encourage desirable behaviour and ways to manage misbehaviour in toddlers. Strategies derived from systematic reviews of parenting programs for treating established child externalising behaviour problems. Program delivered by maternal and child health nurses and co-facilitated by parenting experts.

Arm B: Usual care provided by nurses at well-child visits (active control)

Intervention Type

Other

Phase

Not Specified

Primary outcome measure

Primary outcome 1: Parent-reported child behaviour problems on the Child Behaviour Checklist (Achenbach & Rescorla, 2000). Measured at 18 months, 24 months and 3 years.

Primary outcome 2: Parent-reported parenting practices on the Parent Behaviour Checklist (subscales: developmental expectations, nurturance, harsh discipline) (Fox, 1994). Measured at 18 months, 24 months and 3 years.

Primary outcome 3: Parent-reported mental health on the Depression Anxiety Stress Scales (Lovibond & Lovibond, 1995). Measured at 18 months, 24 months and 3 years.

Secondary outcome measures

Economic evaluation (cost consequences) of cost of delivering the intervention and costs of other sevrices used by families for either the child's behaviour and/or the mother's mental health.

Timepoint: At 18, 24 and 36 months.

Overall study start date

01/12/2001

Completion date

30/06/2006

Eligibility

Kev inclusion criteria

Eligible participants were parents of children aged 6 months attending community well-child clinics across 6 Melbourne local government areas during August/September 2004. Families were recruited from a broad sociodemographic sample.

Participant type(s)

Patient

Age group

Child

Sex

Both

Target number of participants

Target sample size 370. Recruitment status achieved n = 734

Key exclusion criteria

Parents with insufficient English to attend a parenting group and complete brief written questionnaires.

Date of first enrolment

01/12/2001

Date of final enrolment

30/06/2006
