# Study information

## Scientific Title

A multicentre randomised controlled study of primary femoral fixation versus delayed definitive femoral fixation in patients with multiple trauma

## Study objectives

This study aims to compare the effects of early primary intramedullary nailing and delayed femoral intramedullary nailing in patients who have sustained a femoral shaft fracture and multiple injuries with an injury severity score of >16. It will be in particular studying the rates of complications such as multi-organ failure and acute respiratory distress syndrome to see if there is a difference in the incidence of these between the two techniques.

## Ethics approval required

Old ethics approval format

## Ethics approval(s)

Not provided at time of registration

## Study design

Randomised controlled trial

## Primary study design

Interventional

## Study type(s)

Treatment

## Health condition(s) or problem(s) studied

Injury, Occupational Diseases, Poisoning: Femoral shaft fracture

## Interventions

Randomised controlled trial

## Intervention Type

Procedure/Surgery

## Primary outcome(s)

Mean ventilation

## Key secondary outcome(s))

Not provided at time of registration

## Completion date

01/08/2003

# Eligibility

## Key inclusion criteria

10-20 patients who have sustained polytrauma

**Participant type(s)**

Patient

**Healthy volunteers allowed**

No

**Age group**

Not Specified

**Sex**

Not Specified

**Key exclusion criteria**

Does not match inclusion criteria

**Date of first enrolment**

01/08/2002

**Date of final enrolment**

01/08/2003

## Locations

**Countries of recruitment**

United Kingdom

England

**Study participating centre**

St James's University Hospital

Leeds

United Kingdom

LS9 7TF

## Sponsor information

**Organisation**

Department of Health

## Funder(s)

**Funder type**

Hospital/treatment centre

**Funder Name**

Leeds Teaching Hospitals NHS Trust (UK)
