Scientific Title

#### Study objectives

The objective has been to establish whether, in patients with acute malaria who cannot take medication by mouth, rectal artesunate plus referral differs from rectal placebo plus referral in terms of death or permanent disability.

#### Ethics approval required

Old ethics approval format

#### Ethics approval(s)

Ethics approval received on the 8th July 1998.

#### Study design

Randomised controlled trial

#### Primary study design

Interventional

#### Study type(s)

Treatment

#### Health condition(s) or problem(s) studied

Malaria

#### **Interventions**

The sample size determination in the protocol specified that a total of 10,000 non per os patients would need to be randomised in order to detect a reduction of mortality from 5% to 3%.

Individual patients will be randomised to receive either AS suppository (intervention group) or placebo (comparator group). Patients in both groups will then be referred immediately to the nearest hospital/health centre where all supportive treatment will be provided.

#### Intervention Type

Drug

#### Phase

**Not Specified** 

#### Drug/device/biological/vaccine name(s)

Artesunate (AS)

#### Primary outcome(s)

- 1. Number of relevant deaths in the intervention and control arm assessed 7 30 days after enrolment (relevant defined as malaria positive patients in whom the death was probably /definitely preventable by the intervention)
- 2. Number of individuals with serious neurological disability in the intervention and control arms assessed at 7 30 days following enrolment in the study. Neurological disability defined as the development of new problems with feeding, walking, talking, sitting, sight, hearing, playing, balance and behaviour

# Key secondary outcome(s))

- 1. Number of deaths in the intervention and control arm assessed 7 30 days following enrolment in the study
- 2. Number of cases of neurological disability in the intervention and control arms assessed at 7 30 days following enrolment in the study
- 3. Number of cases of neurological disability in malaria smear positive patients in the intervention and control arms assessed at 7 30 days following enrolment in the study
- 4. Number of cases of neurological disability in children in the intervention and control arms assessed at 7 30 days following enrolment in the study
- 5. Number of cases of neurological disability in pregnant women in the intervention and control arms assessed at 7 30 days following enrolment in the study
- 6. Number of deaths and neurological sequelae in the intervention and control arm in malaria smear positive patients who survived at least 8 hours but died before 7 days after enrolment in the study

#### Completion date

08/07/2000

# Eligibility

#### Key inclusion criteria

- 1. Children above crawling age and adults of any age group
- 2. Clinical diagnosis of probable P. falciparum malaria (fever, or history of fever without any other obvious cause of fever). Clinical features must include fever or history of fever and at least one of the following:
- 2.1. Unable to take food, drink or suck
- 2.2. Prostration: inability to sit, stand or walk unaided
- 2.3. Any abnormal level of consciousness i.e. from abnormal behavior, obtunded (limited response to painful stimulus), to coma (unconsciousness with absent verbal response and non-specific or absent motor response)
- 2.4. Fits or history of fits (defined as more than one fit in the previous 24 hours)
- 3. Consent by patient or parent/quardian if patient is less than 18
- 4. Community informed consent at the start of the study in that area, community consent to the project would have been obtained

# Participant type(s)

Patient

# Healthy volunteers allowed

No

#### Age group

**Not Specified** 

#### Sex

#### Key exclusion criteria

- 1. Afebrile (history/examination)
- 2. Unwillingness to sign (or parental signature) informed consent for study participation
- 3. Ability to take oral medication
- 4. Diarrhoea (at least two loose bowel movements in the previous two hours)

N.B. Pregnant or breast-feeding women will not be excluded from the study. Status of pregnancy in female will be noted in the Case Record Form (CRF).

# Date of first enrolment

08/07/1998

#### Date of final enrolment

08/07/2000
