Study information

Scientific Title

Asymmetry in infancy - a prospective, randomised trial: the effect of pediatric physical therapy on the course of postional preference, deformational plagiocephaly and subsequent developmental delay, in children of 6 weeks to 24 months of age, measured with plagiocephalometry, range of motion tests and motor assessment

Study objectives

Pediatric physical therapy is effective in asymmetry in infancy, especially to positional preference, deformational plagiocephaly and natural course of asymmetrical motor development, established by plagiocephalometry, range of motion tests and motor assessment.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Ethics approval received from the local ethics committee

Study design

Randomised, single blinded, active controlled, parallel group trial

Primary study design

Interventional

Study type(s)

Treatment

Health condition(s) or problem(s) studied

No condition, healthy person

Interventions

Study population:

Group 1: Positional preference (+/- deformational plagiocephaly) with pediatric physical therapy

Group 2: Positional preference (+/- deformational plagiocephaly) without pediatric physical

therapy

Group 3: Deformational plagiocephaly without positional preference

Group 4: No positional preference and/or deformational plagiocephaly

Intervention Type

Other

Phase

Not Specified

Primary outcome(s)

Parameters:

- Shape of the head established by the features and values of plagiocephalometry
- 2. Active and passive range of motion measurements of the cervical column
- 3. Motor development by the Alberta Infant Motor Scale and the Bailey Scales of Infant Development second edition

All outcome parameters will be established at 4 investigation moments: T0 to T3

T0 = 6-8 weeks

T1 = 6 months

T2 = 12 months

T3 = 24 months

Key secondary outcome(s))

Answers to the questionnaires to investigate the experiences of parents of all participating children

Completion date

01/10/2007

Eligibility

Key inclusion criteria

- 1. Healthy infants of 6 to 8 weeks of age, born at or after a gestational age of 36 weeks or more, without dysmorphisms or syndromatic symptoms
- 2. With or without positional preference of the head and with or without deformational plagiocephaly
- 3. Positional preference and deformational plagiocephaly are based on positional torticollis

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Child

Lower age limit

6 weeks

Upper age limit

8 weeks

Sex

All

Key exclusion criteria

- 1. Positional preference caused by pathology, for example congenital muscular torticollis, structural scoliosis, osseal disorders, cerebral palsy
- 2. Dysmorphism
- 3. Syndromes
- 4. Synostotic plagiocephaly (craniosynostosis)

Date of first enrolment
