Study information

Scientific Title

A randomised controlled trial of a pre-assessment clinic for paediatric general surgery day cases

Study objectives

The aim of this study was to compare two methods of preparing children and their parents for day case surgery. The two methods that were compared were providing information on the day of surgery (previous practice) versus providing information before admission at a preassessment clinic.

Participant information sheet

Health condition(s) or problem(s) studied

Paediatric surgery

Interventions

- 1. Information given on the day of admission
- 1. Information given at the preassessment clinic before admission

Intervention Type

Procedure/Surgery

Phase

Not Applicable

Primary outcome measure

- 1. Behavioural distress of the child around the time of the surgery
- 2. Behavioural disturbance of the child immediately after discharge from hospital and 4 months later
- 2.1. Vernon post-hospital behaviour scale
- 2.2. Rowe behavioural rating inventory
- 3. Likert-scale anxiety ratings of parent and child during the admission (completed by the parent prior to discharge)
- 4. Compliance of parents with home care instructions

Secondary outcome measures
