Study information

Scientific Title

Evaluation of the Threshold Assessment Grid (TAG) as a means of improving access from primary care to secondary mental health services

Acronym

TAG

Study objectives

Primary hypothesis: Using the TAG will significantly improve the agreement between the GP and the adult mental health team on the appropriateness of the referral

Secondary hypotheses: Receiving a TAG with a referral letter will make it significantly easier for the mental health team to identify

- a. The urgency of the referral
- b. The most appropriate professional to make the initial assessment

Ethics approval required

Old ethics approval format

Ethics approval(s)

Added as of 06/08/2007: The study was approved by Metropolitan Multi-centre Ethics Committee (04/MRE11/8) with Local REC approval in London and Manchester, and research governance support from the relevant Primary Care Trusts and Mental Health Trusts.

Study design

Randomised controlled trial.

Primary study design

Interventional

Secondary study design

Randomised controlled trial

Study setting(s)

Participant information sheet

Health condition(s) or problem(s) studied

Mental health

Interventions

Control group: referrers to CMHTs asked to make referrals using a referral letter or form as per existing practice.

Intervention group: referrers to CMHTs asked to complete a Threshold Assessment Grid (TAG) in addition to a referral letter, and given guidance on its contents.

Amendments to the trial as of 01 June 2005:

1. We will now be paying GP practices £100 to cover administrative costs incurred in providing us with service use data for the 5-10 patients they referred to mental health teams during Jan - June 2005. To facilitate this service use data collection, the name and date of birth of referred patients will be recorded at the mental health team referral meeting.
2. We will now be paying GPs £100 for their time in being interviewed to learn about their experiences of using TAG
3. We will be interviewing key informants in mental health teams about their experience in receiving TAGs with the referral letter
4. We will be extending the randomised controlled trial (RCT) from 6 to 9 months, so it finishes on 30 September 2005 instead of 30 June 2005.

Intervention Type

Other

Phase

Not Specified

Primary outcome measure

CMHT rating of appropriateness of the referral.

Secondary outcome measures

CMHT rating of the quality of information to inform decision-making about urgency of the referral and which professional should make the initial assessment. In addition to this, service usage data will be collected to allow cost effectiveness analysis.

Overall study start date

01/01/2005

Completion date

30/09/2005

Eligibility

Key inclusion criteria

General Practitioners (GPs) and other referrers to Community Mental Health Teams (CMHTs).

Participant type(s)

Patient

Age group

Adult

Sex

Both

Target number of participants

73 GP practices (37 control, 36 intervention)

Total final enrolment

73

Key exclusion criteria

None

Date of first enrolment

01/01/2005

Date of final enrolment

30/09/2005
