Study information

Scientific Title

Dutch Obesity Intervention in Teenagers: a school-based intervention program to improve dietary and physical activity behaviour in adolescents, in order to prevent excessive weight gain

Acronym

DOiT

Study objectives

It is hypothesised that the intervention will result in:

1. A difference between the intervention and the control group of at least 0.5 kg of body weight gain in favour of the intervention group after a one-year intervention period
2. Furthermore, a difference between the intervention and control group is expected of 7% (0.5 points on a 7-point scale) in cognitions (i.e. awareness, attitude, subject norm and self-efficacy) and 7% (0.5 points on a 7-point scale) in the behavioural intention of reaching a more favourable energy-balance

Ethics approval required

Prevention

Health condition(s) or problem(s) studied

Overweight and obesity

Interventions

An educational program was developed and implemented in the biology and physical education lessons. These lessons aimed at increasing awareness and behavioural changes concerning energy intake, consumption of sugar-sweetened drinks and energy-dense snacks in particular; and energy output i.e. physical activity and sedentary behaviours. In addition, schools were advised on modifying the canteens, and requested to provide additional physical education classes in order to facilitate behavioural change.

Furthermore, participants are requested to choose at least one of four intervention options aimed at the individual, two regarding physical activity and two regarding food intake.

Control intervention: The regular school curriculum.

Intervention Type

Behavioural

Primary outcome(s)

Weight, height, and body composition (based on waist, arm, and thigh circumferences, and four skinfolds: triceps, biceps, subscapular, supra iliac), dietary behaviour (by questionnaires focusing on snacking and soft drinks), physical activity (by questionnaire in the whole group, and in a subgroup by accelerometers) and physical inactivity (by questionnaire).

Key secondary outcome(s)

1. Cognitions and intention (awareness, attitude, subjective norms, descriptive norms, self-efficacy - by questionnaire) related to recommended physical activity levels and dietary behaviours
2. Intention towards reaching a more favourable energy-balance
3. Compliance and appraisal of trial components (all by questionnaire)
4. Aerobic fitness by the 20 m shuttle run-test

Completion date

31/08/2006

Eligibility

Key inclusion criteria

Dutch adolescent boys and girls aged 12 - 14 years attending pre-vocational education

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Child

Lower age limit

12 years

Upper age limit

14 years

Sex

All

Key exclusion criteria

No exclusion criteria

Date of first enrolment

01/08/2002

Date of final enrolment

31/08/2006
