Plain English summary of protocol

Background and study aims

Many current treatment options for managing overweight and obesity consist of rather strict diet and exercise regimes that are difficult to implement as a lifelong routine. Therefore, alternative initiatives such as mindful eating and pleasure-oriented physical activity with more focus on implementation and enjoyment are needed to reverse the obesity epidemic. Mindful eating is an approach focusing on inner hunger and satiety (fullness) signals. YogaDance is a new exercise approach combining elements of yoga and dance. The aim of this study is to investigate the individual and combined effects of mindful eating and YogaDance.

Who can participate?

Healthy, inactive women with overweight or obesity

What does the study involve?

Participants were randomly allocated to one of four groups for 8 weeks: mindful eating alone, YogaDance alone, the combination of mindful eating and YogaDance, or control. The combined mindful eating and YogaDance intervention group followed three weekly YogaDance classes and a mindful eating workshop every second week (in total four workshops) for a total period of 8 weeks. The mindful eating intervention group only attended the four mindful eating workshops and the YogaDance intervention group only followed the three weekly YogaDance classes. The control group did not participate in the YogaDance classes nor the mindful eating workshops. Fat mass, body weight, waist circumference, other physiological outcomes, behavioral and quality of life are measured.

What are the possible benefits and risks of participating?

Benefits include weight loss as well as improved eating behavior and quality of life.

Where is the study run from?

University of Copenhagen (Denmark)

When is the study starting and how long is it expected to run for?
February 2021 to April 2022

Who is funding the study?
Investigator initiated and funded

Who is the main contact?
Prof. Christian Ritz, ritz@sdu.dk

Study information

Scientific Title
Effects of mindful eating and YogaDance among overweight and obese women – an exploratory randomized controlled trial

Study objectives

The aim of this study was to explore the effect of combining mindful eating and the novel YogaDance approach in overweight and obese women. The hypothesis was that the combination would lead to a reduction in total body fat mass (compared to a control group).

Ethics approval required

Old ethics approval format

Ethics approval(s)

Approved 01/07/2021, Ethics Committee of the capital region of Denmark (De Videnskabetiske Komiteer, Region Hovedstaden, Borgervænget 3, st., 2100 Copenhagen OE, Denmark; +45 (0)38 66 63 95; vek@regionh.dk), ref: H-21013705

Study design

Parallel-arm open-label randomized controlled superiority trial

Primary study design

Interventional

Study type(s)

Prevention

Health condition(s) or problem(s) studied

Prevention of overweight and obesity in women

Interventions

Participants were allocated by block randomization to one of three intervention groups (mindful eating alone, YogaDance alone, or mindful eating and YogaDance combined) or the control group in a 1:1:1:1 ratio. This trial design enabled the assessment of the two approaches mindful eating and YogaDance separately as well as jointly. The combined mindful eating and YogaDance intervention group followed three weekly YogaDance classes and a mindful eating workshop every second week (in total four workshops) for a total period of 8 weeks. This training intensity was selected to ensure participant adherence and meet the recommendations by WHO for physical activity for adults (i.e., 150 minutes at moderate intensity or 75 minutes at high intensity per week). The mindful eating intervention group only attended the four mindful eating workshops and the YogaDance intervention group only followed the three weekly YogaDance classes. The control group did not participate in the YogaDance classes nor the mindful eating workshops.

Intervention Type

Other

Primary outcome(s)

Fat mass is measured using a dual-energy x-ray absorptiometry (DXA) scanner (Lunar iDXA with CoreScan module, GE Healthcare, Denmark) at baseline and again at end of the study after 8 weeks

Key secondary outcome(s)

Measured at baseline and after the intervention was completed (at 8 weeks):

1. Body weight measured using a calibrated digital scale (Tanita WB-110MA)
2. BMI defined as body weight divided by height squared

3. Waist circumference measured using a non-elastic band
4. Fat percent measured using a DXA scanner
5. Fat-free mass measured using a DXA scanner
6. Visceral fat measured using a DXA scanner
7. Bone mineral density measured using a DXA scanner
8. Blood pressure measured using a validated automatic blood pressure monitor (UA-787 Plus)
9. Quality of life measured using the WHO-QOL-100 questionnaire
10. Eating behavior measured using a Danish version of the IES-2 questionnaire
11. Energy intake measured using 3-day dietary records
12. Physical activity measured using the International Physical Activity Questionnaires (IPAQ)

Completion date

10/04/2022

Eligibility

Key inclusion criteria

1. Women between 18 and 65 years of age
2. Body mass index (BMI) between 25-35 kg/m² and/or a waist circumference of ≥80 cm
3. Healthy
4. Have an inactive lifestyle, defined as <2.5 hours of light physical activity per week or <1 hour of moderate to hard physical activity per week

Participant type(s)

Healthy volunteer

Healthy volunteers allowed

No

Age group

Adult

Lower age limit

18 years

Upper age limit

65 years

Sex

Female

Total final enrolment

61

Key exclusion criteria

1. Pregnant, breastfeeding or plan to become pregnant within the study period
2. Self-reported severe disease (including cancer, cardiovascular disease [CVD], type 1 or 2 diabetes, osteoporosis)

3. Self-reported eating disorder (e.g., anorexia, bulimia, orthorexia, binge eating disorder)
4. Following a very restrictive diet (i.e. excluding several food items)
5. Participation in other studies

Date of first enrolment
