Study information

Scientific Title

Acronym
SALT STUDY

Study objectives
To determine the effects of altering dietary sodium intake or daily physical activity on plasma concentrations of N-Terminal BNP in normal subjects and patients who have had a prior Q-wave MI.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Not provided at time of registration

Study design
Randomised controlled trial

Primary study design
Interventional

Study type(s)
Quality of life

Health condition(s) or problem(s) studied
Sodium intake

Interventions
The results of this trial will be used to inform clinical decision making based on NT_BNP results. Other areas involved: Cardiology, Nuclear Medicine Department.

The study is an open-label, randomised trial comparing the effects of varying dietary sodium and level of daily activity in 30 normal subjects patients recruited from General Practice and 30 patients with prior Q-wave myocardial infraction at the Nuclear Medicine Department at Hull Royal Infirmary.

Intervention Type
Other

Phase
Not Applicable

Primary outcome(s)
Brain Natriuretic Peptides (BNP)

Key secondary outcome(s))
Not provided at time of registration

Completion date
09/04/2007

Reason abandoned (if study stopped)
Lack of staff/facilities/resources

Eligibility

Key inclusion criteria
1. 30 normal subjects over 60 years old
2. 30 mobile patients over 60 years old who have had a Q-wave MI and left ventricular ejection fraction (LVEF) less than 45%

Resources/Patient:
1. Electrocardiogram (ECG)
2. Echocardiography
3. Treadmill exercise with VO2 measurement for each patient

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Senior

Sex
All

Key exclusion criteria
1. No angina
2. No heart failure
3. Not receiving diuretics
4. No renal impairment

Date of first enrolment
09/02/2005

Date of final enrolment
09/04/2007
