#### Scientific Title

Wolbachia endobacteria in filarial infections - exploring their usefulness as targets for novel chemotherapies that are anti-filarial and improve lymphoedema: a randomised double blind placebo-controlled trial

# **Study objectives**

Filarial infections belong to the major diseases in sub-Saharan Africa and are strongly associated with poverty. At present, World Health Organization (WHO) led control activities in Africa mainly rely on mass administration of microfilaricidal drugs, with a measure of success. However, it has become clear that new, complementary therapies, ideally being macrofilaricidal, must be developed for sustainable control.

In lymphatic filariasis (LF), there is the additional need to deliver new therapies for lymphatic pathology, i.e. lymphoedema and urogenital pathology such as hydrocele and lymphocele, which are not targeted by current mass drug administrations. Depletion of Wolbachia essential endosymbionts of filariae with doxycycline, an approach established by our group, resulted in macrofilaricidal activity in LF. The present study hypothesises that Wolbachia also play a major role in inducing and maintaining lymphatic pathology, and that doxycycline may therefore improve lymphoedema.

## The aim of this project is:

- 1. To analyse to what extent lymphoedema is caused by Wolbachia. To this, the Wolbachia-depleting antibiotic doxycycline will be compared with amoxicillin, which does not target Wolbachia but only opportunistic exogenous bacteria that may worsen lymphoedema.
- 2. To analyse the role of Wolbachia in the systemic immune responses in lymphoedema patients, by comparing immune responses before and after Wolbachia depletion

# Ethics approval required

Old ethics approval format

# Ethics approval(s)

The Committee on Human Research Publication and Ethics, Kwame Nkrumah University of Science and Technology, Kumasi, Ghana approved on 25th November 2005

# Study design

Randomised double blind placebo-controlled trial

# Primary study design

Interventional

# Study type(s)

Treatment

# Health condition(s) or problem(s) studied

Lymphatic filariasis (Wuchereria bancrofti)

#### **Interventions**

Study drugs and treatment regimens:

- 1. 200 mg/day doxycycline for 6 weeks
- 2. 1000 mg/day amoxicillin for 6 weeks
- 3. Placebo for 6 weeks

## Intervention Type

Drug

#### Phase

Phase II

# Drug/device/biological/vaccine name(s)

Doxycycline, amoxicillin

## Primary outcome(s)

Reduction of the stage of lymphoedema and number of acute attacks, measured pre-treatment as well as 3 months, 12 months and 24 months after the start of drug administration

# Key secondary outcome(s))

- 1. Reduction in circulating filarial antigen levels as a measure of a macrofilaricidal effect of doxycycline
- 2. Change in systemic immune responses

All measured pre-treatment as well as 3 months, 12 months and 24 months after the start of drug administration.

# Completion date

30/03/2009

# **Eligibility**

## Key inclusion criteria

- 1. Men and women aged between 18 60 years
- 2. Resident in the village for five years or more

- 3. Clinical stage of lymphoedema (1 5) of at least one extremity
- 4. Good general health without any clinical condition requiring long-term medication
- 5. Minimum body weight 40 kg

# Participant type(s)

Patient

## Healthy volunteers allowed

No

## Age group

Adult

# Lower age limit

18 years

#### Sex

All

#### Key exclusion criteria

- 1. Pregnancy (if not obvious all women are tested by dipstick chemistry: beta-human chorionic gonadotrophin [BhCG])
- 2. Currently breast-feeding
- 3. Evidence of clinically significant neurological, cardiac, pulmonary, hepatic, rheumatological, or renal disease by history, physical examination, and/or laboratory tests
- 4. Behavioural, cognitive or psychiatric disease that, in the opinion of the investigator, affects the ability of the volunteer to understand and cooperate with the study protocol
- 5. Laboratory evidence of liver disease (aspartate aminotransferase [AST], alanine aminotransferase [ALT] and/or gamma-glutamyl transferase [gGT] greater than 1.25 times the upper limit of normal of the testing laboratory)
- 6. Laboratory evidence of renal disease (serum creatinine greater than 1.25 times the upper limit of normal of the testing laboratory)
- 7. Other condition that, in the opinion of the investigator, would jeopardise the safety or rights of a volunteer participating in the trial or would render the subject unable to comply with the protocol
- 8. Volunteer has abused alcohol or illicit drugs during the past 6 months by history
- 9. History of severe allergic reaction or anaphylaxis
- 10. Intolerance to doxycycline or amoxicillin

#### Date of first enrolment

01/12/2005

#### Date of final enrolment

30/03/2009
