Study information

Scientific Title

Study objectives

Preventive home visits to elderly people by public health nurses aim to maintain or improve the functional status of elderly and reduce the use of institutional care services. A number of trials that investigated the effects of home visits show positive results, but others do not. The outcomes can depend on differences in characteristics of the intervention programme, but also on the selection of the target population. A risk group approach seems promising, but further evidence is needed. We decided to carry out a study to investigate the effects in a population of elderly with (perceived) poor health rather than the general population. Also, we test whether nurses who are qualified at a lower professional level (home nurses instead of public health nurses) are able to obtain convincing effects. The results of this study will contribute to the discussion on effective public health strategies for the aged.

Self-reported (perceived) health problems

Interventions

The intervention consists of (at least) 8 systematic home visits over an 18 months period. Experienced home nurses from the local home care organisation carry out the visits. The control group receives usual care.

Intervention Type

Primary outcome measure

The outcome measures cover 2 domains: health status and service use. In addition a cost effectiveness analysis will be conducted.

The primary health related outcome measures are: self-rated health, functional status, quality of life and changes in self-reported problems.

The use of services relates to the frequency and duration of care from the following services: domestic and community nursing care, GP, physiotherapy, day care in institutional care settings, hospital outpatient clinics, hospital, nursing home, home for the elderly, use of aids and modifications to the home. The primary outcomes for service use are specialist medical care and hospital (re-) admission.

Secondary outcome measures

Secondary health related outcome measures: information will be obtained, among other things, on health complaints, medication use, and loneliness and mental health. The municipality will supply mortality data over the entire research period.

Overall study start date

01/05/2002

Completion date

30/11/2006

Eligibility

Key inclusion criteria

Elderly (70-84 years) living in the community with self-reported poor health status

Participant type(s)

Patient

Age group

Senior

Sex

Both

Target number of participants

330

Key exclusion criteria

Those who already receive home nursing care

Date of first enrolment

01/05/2002

Date of final enrolment

30/11/2006
