## Plain English summary of protocol

### Background and study aims

Physiotherapists should not only focus on treatment of disease, but also develop interventions and measures with regard to health promotion and prevention. Health promotion and prevention at school is already a well investigated area. The focus is generally on pupils' health, but the health of teachers should also be an important aim. A study found that the health of teachers in Austrian schools was poor, and the most common complaints were low back pain, fatigue, exhaustion and neck/shoulder pain. 50.8 % of the teachers reported that they occasionally suffer from at least one of the mentioned complaints. Therefore posture and movement management programs seem to be a promising approach in health promotion and prevention programs for teachers. The aim of this study is to improve health-related quality of life and work-related behavior of teachers in schools in Austria by means of health promoting and preventive physiotherapy.

### Who can participate?

Teachers aged between 20 and 63 at compulsory schools in Austria

### What does the study involve?

Participating schools are randomly allocated to either the intervention group or the control group. The intervention group schools carry out a physiotherapy program over one academic semester (6 months), where teachers receive six 30-minute sessions of posture and movement training. The control group schools are offered a physiotherapy program after the study is finished. Health-related quality of life and work-related behavior patterns are measured at the beginning and the end of the semester.

### When is study starting and how long is it expected to run for?

As this study focuses on health promotion and preventive physiotherapy no risks for participants are expected.

Who is funding the study?

1. Institute for Health Sciences, University of Applied Sciences of St. Pölten (Austria)
2. Local Government of St. Pölten (Austria)

Who is the main contact?

Prof. Astrid Figl-Hertlein

## Study information

### Scientific Title

Effect of a health promoting posture and movement management at work on teachers' health-related quality of life and work related behavior: a randomized controlled study

### Study objectives

The overall aim of the present study was to evaluate the effect of a six-month health-promotion and preventive physiotherapy program (Posture and Movement Management) in the manner of an institutional and regulatory action in school for teachers on quality of live and work related behavior patterns.

Specific research questions are:

1. Health promoting posture and movement management at work in the manner of an institutional and regulatory action in school influences the health-related quality of life (QOL) of school teachers in Austria.
2. Health promoting posture and movement management at work in the manner of an institutional and regulatory action in school influences the work related behavior of school teachers in Austria.

### Ethics approval required

Old ethics approval format

### **Ethics approval(s)**

Ethics Committee of the Federal Government of Lower Austria, ref: GS4-EK-4/106-2010

### **Study design**

Cluster randomized controlled study

### **Primary study design**

Interventional

### **Study type(s)**

Prevention

### **Health condition(s) or problem(s) studied**

Musculoskeletal disorders (low back pain, fatigue, exhaustion and neck/shoulder pain)

Study domain: Health promotion and prevention

### **Interventions**

The health promoting posture and movement management for the intervention groups was a institutional and regulatory action at the working place (in this case at the schools). This institutional and regulatory action can be seen as a structural school-intern support of a health professional at work and therefore as a change of working conditions. A physiotherapist was responsible for all IG-schools over the period of one academic semester and therefore for the duration of this study. Teachers of the IG had the opportunity of receiving six times of comprehensive preventive posture and movement management for 30 minutes each session. This program included posture and movement training, counselling of coping strategies and ergonomics, exercises and body perception- and body experience-training. The program did not aim at any intervention in rehabilitation and therapy. Goal of this program was to offer strategies for healthy and ergonomic posture and movement during work. Further participants should be educated to use those strategies in their own way and life. This goal is in strong accordance to salutogeneses-model defined by Aaron Antonovsky and WHO health-policies, and therefore aims at strengthening personal capabilities for resisting stress.

### **Intervention Type**

Other

### **Phase**

Not Applicable

### **Primary outcome(s)**

1. Health-related quality of life (SF-36 questionnaire)
2. Work related behavior patterns (AVEM questionnaire)

The results will be measured at baseline (before intervention, the beginning of the semester) and after 6 months (end of the semester)

### **Key secondary outcome(s)**

1. Maslach Burnout Inventory (short form)
2. HBSC Symptom Checklist
3. IPAQ (International physical activity questionnaire)

**Completion date**

31/01/2012

**Eligibility****Key inclusion criteria**

Adult teachers from compulsory schools in Austria of both sexes, aged between 20 and 63 years who were able to work

**Participant type(s)**

Other

**Healthy volunteers allowed**

No

**Age group**

Adult

**Sex**

All

**Key exclusion criteria**

Eligibility was not given when participants had chronic or acute psycho-neuro-motor disease, disabilities, fractures or when ability to work was not given

**Date of first enrolment**

01/12/2008

**Date of final enrolment**

31/01/2012
