Plain English summary of protocol

Background and study aims

Option Grids are one-page evidence-based summaries of the available condition-specific treatment options, listing patients frequently asked questions. They are designed to be brief and accessible enough to support better communication between patients and doctors during routine consultations. This study aims to find out whether an Option Grid for osteoarthritis of the knee (OA of the knee) aids in shared decision making (SDM), and to explore the use of Option Grids by patients with language difficulties or poor medical knowledge.

Who can participate?

Patients over the age of 18 with osteoarthritis of the knee referred to a specialist musculoskeletal clinic in Oldham (Pennine MSK Ltd) can participate.

What does the study involve?

We will collect information from two groups of people: one group will be given an Option Grid by their doctor in their appointment; the other group will not be given an Option Grid by their doctor. We will then compare the information we collect from both groups to see if there are any differences.

What are the possible benefits and risks of taking part?

The information we gain from this study may help us provide future patients with osteoarthritis of the knee with better information about the available treatment options. Apart from the time and effort required to take part in the study, we foresee no difficulties or risks to taking part.

Where is the study run from?

The study is being run by researchers in the School of Medicine at Cardiff University, UK.

When is the study starting and how long is it expected to run for?

Recruitment to the study started in September 2013 and is expected to finish in March 2014.

Who is funding the study?
The study is being funded by the Bupa Foundation, UK.

Who is the main contact?
Dr Fiona Wood
wood@cardiff.ac.uk

Study information

Scientific Title
Option Grids: easy to use shared decision making tools for disadvantaged groups a stepped wedge exploratory trial

Acronym
TOGA

Study objectives
It is hypothesised that levels of shared decision making (as measured by the OPTION tool) will be higher in consultations where an option grid is used by patients and clinicians.

Ethics approval required

Health condition(s) or problem(s) studied

Osteoarthritis of the knee

Interventions

Six physiotherapists will sequentially join the trial and consult with six patients using usual care procedures. After a period of brief training in using the Option Grid, the same six physiotherapists will consult with six further patients using an Option Grid in the consultation. The primary outcome will be efficacy of the Option Grid in facilitating SDM as measured by observational scores using the OPTION scale. Comparisons will be made between patients who have received the Option Grid and those who received usual care. A Decision Quality Measure (DQM) will assess quality of decision making. The health literacy of patients will be measured using the REALM-R instrument. Consultations will be observed and audio-recorded. Interviews will be conducted with the physiotherapists, patients and any interpreters present to explore their views of using the Option Grid.

There is no randomisation. Patients are sequentially assigned to the next clinician who is either in the pre-intervention or post-intervention stage.

Intervention Type

Phase

Not Applicable

Primary outcome measure

The primary outcome is the efficacy of the Option Grid in facilitating Shared Decision Making as measured by observer scores using the OPTION scale.

Secondary outcome measures

Secondary analysis will explore:

1. The quality of decision making as measured by the Decision Quality Measure (DQM); treatment decision at 3 months post consultation
2. The extent to which the intervention has reached disadvantaged groups as measured by the literacy of participants utilising the REALM-R instrument and socio-demographic variables
3. A qualitative investigation will explore the acceptability of the option grid to patients and physiotherapists and how these tools are used in consultations where interpreters are present

Overall study start date

01/09/2012

Completion date

01/03/2014

Eligibility

Key inclusion criteria

Patients over the age of 18 with osteoarthritis of the knee who are referred to the Pennine MSK specialist musculoskeletal centre.

Clinicians will be employed by Pennine MSK.

Participant type(s)

Patient

Age group

Adult

Lower age limit

18 Years

Sex

Both

Target number of participants

72

Key exclusion criteria

There are no specific exclusion criteria. We will only exclude those patient participants who are unable to communicate adequately in English (as judged by their ability to understand the participant information sheet) and where we do not have interpreters or family members available to assist their participation.

Date of first enrolment

01/09/2012

Date of final enrolment

01/03/2014
