Plain English summary of protocol

Background and study aims
The objective of this study is to assess the impact of the drug tadalafil on endometrial growth (growth of the inner lining of the uterus, or womb), and blood flow to and from the uterus (measured by uterine artery pulsatility (PI)) and resistance index (RI)) in female patients being treated for infertility with clomiphene in order to encourage ovulation.

Who can participate?
Infertile female patients aged between 18-42 taking clomiphene to encourage ovulation.

What does the study involve?
Participants are randomly allocated into one of two groups. Those in group 1 are placed in cycle A. They are treated with 100mg clomiphene citrate per day from day 2 to day 6 of the cycle and 5mg tadalafil per day from the 4th day to the 10th day of the cycle. Those in group 2 are placed in cycle B. These participants are treated only with the 100mg clomiphene citrate per day from day 2 to day 6 of the cycle. After being treated in cycle A or B, all participants are then reallocated to the other cycle and treated accordingly. Endometrial growth, PI and RI are assessed for all participants on day 4, 8 and 12 of each cycle.

What are the possible benefits and risks of participating?
Not provided at time of registration.

Where is the study run from?
The Zambrano Hellion Medical Center, Monterrey Institute of Technology (Mexico)

When is the study starting and how long is it expected to run for?
September 2014 to August 2015

Who is funding the study?
1. Monterrey Institute of Technology and Higher Education (Tecnológico de Monterrey) (Mexico)
2. CREASIS - Assisted Reproduction Center (Mexico)

Who is the main contact?
Dr Daniel Humberto Mendez Lozano
danielmendez@itesm.mx

Study information

Scientific Title
PDE inhibitors and endometrial growth under clomiphene ovarian stimulation

Study objectives
1. Long lasting phosphodiesterase inhibitors decreases the uterine artery pulsatility index on clomiphene ovarian stimulation
2. Long lasting phosphodiesterase inhibitors improve the endometrial growth on clomiphene ovarian stimulation

Ethics approval required
Old ethics approval format

Ethics approval(s)
Institutional Ethics Committee, 27/08/2013, ref: IPDE5EC

Study design
Randomised single centre cross over study

Primary study design

Interventional

Secondary study design
Randomised cross over trial

Study setting(s)
Hospital

Study type(s)
Treatment

Participant information sheet
Not available in web format, please use contact details to request a participant information sheet

Health condition(s) or problem(s) studied
Infertility. Poor endometrial growth.

Interventions
Patients will be randomized according to previously sealed envelopes in order to start with Cycle A or Cycle B.

1. Cycle A: patients will receive clomiphene citrate 100 mg/day from the 2nd to the 6th day of the cycle and also tadalafil 5 mg/day from the 4th day to the 10th day of the cycle.
2. Cycle B (control): patients will only receive clomiphene citrate 100 mg/day from the 2nd to the 6th day of the cycle.

All patients will be monitored until the evidence of clinical pregnancy by ultrasound.

Intervention Type
Drug

Phase
Phase II

Drug/device/biological/vaccine name(s)
Tadalafil

Primary outcome measure
Endometrial growth, using ultrasound scans at day 4, 8 and 10.

Secondary outcome measures
1. Uterine artery pulsatility index
2. Uterine artery resistant index

Measured by ultrasound on Day 4, 8 and 10.

Overall study start date
01/09/2014

Completion date

31/08/2015

Eligibility

Key inclusion criteria
1. Infertile patients candidates to clomiphene ovarian stimulation
2. Female
3. 18 to 42 years old

Participant type(s)
Patient

Age group
Adult

Lower age limit
18 Years

Sex
Female

Target number of participants
30

Key exclusion criteria
1. Smoking
2. Arterial hypertension
3. Prior uterine surgery

Date of first enrolment
01/09/2014

Date of final enrolment
31/08/2015
