Study information

Scientific Title
BAIL-OUT: 'Bail-out Anticoagulation in coronary Intervention TriaL - OUTcomes': a randomised comparison of the real world use of bivalirudin versus abciximab as a 'bail out' anticoagulant following heparin in percutaneous coronary intervention with focus on patient safety

Acronym
BAIL-OUT

Study objectives
Non-inferiority exists in terms of bleeding complication rates between bivalirudin and abciximab (ReoPro) when used as provisional (Bail-out) anticoagulants during Percutaneous Coronary Intervention (PCI).

Ethics approval required
Old ethics approval format

Ethics approval(s)
Leicestershire, Northamptonshire and Rutland REC 1, 13/10/2006, ref: 06/Q2501/197

Study design
Single-centre open-label randomised controlled trial

Primary study design
Interventional

Secondary study design
Randomised controlled trial

Study setting(s)
Hospital

Study type(s)
Treatment

Participant information sheet
Not available in web format, please use the contact details to request a patient information sheet

Health condition(s) or problem(s) studied

Coronary artery disease

Interventions
Provisional bivalirudin versus provisional Abciximab following bolus heparin (65 u/kg) during PCI. The trial anticoagulant is given as per normal protocol, i.e., Bivalirudin bolus 0.75 mg/kg followed by infusion of 1.75 mg/kg/hr for duration of procedure only and Abciximab bolus and infusion for 12 hours.

Data collected from baseline, day of discharge post PCI and 30 days post PCI.

Intervention Type
Drug

Phase
Phase IV

Drug/device/biological/vaccine name(s)
Bivalirudin, abciximab (ReoPro), heparin

Primary outcome measure
Major and minor bleeding complication rate

Secondary outcome measures
1. Major Adverse Coronary Events (MACE)
2. Peri-procedural Troponin T level

Overall study start date
01/11/2006

Completion date
01/04/2008

Eligibility

Key inclusion criteria
Patients undergoing planned elective PCI at Leicester Glenfield Hospital without requirement for up-front GlycoProtein (GP) IIb IIIa after consent from patient and operator, randomised when Bail out situation is deemed to have occurred by the operator, which requires additional anticoagulation. There will be no limitation of concomitant therapy. All therapeutic regimens will be documented on the Case Report Form (CRF).

Indications for additional anticoagulation (and hence randomisation) will include but not be restricted to:
1. Abrupt or side-branch closure
2. Obstructive dissection
3. New or suspected thrombus
4. Impaired or slow coronary blood flow
5. Distal embolisation of thrombus
6. Persistent residual stenosis
7. Unplanned stent placement

8. Prolonged ischaemia
9. Other clinical instability or at discretion of the operator

Participant type(s)
Patient

Age group
Not Specified

Sex
Not Specified

Target number of participants
50 per group = 100 patients

Key exclusion criteria
1. Any contra-indication to Bivalirudin or ReoPro as per product licence
2. Primary PCI for acute myocardial infarction
3. Uncontrolled sustained Blood Pressure (BP) more than 200/110 mmHg
4. Previous PCI within one month
5. Active bleeding, surgery, trauma or Gastro-Intestinal (GI) bleeding within 6/52
6. Serious intracranial pathology or previous bleed
7. Disseminated malignancy
8. Potential bleeding diathesis or other contra-indication to anticoagulation
9. Platelet count less than 100
10. Serum creatinine more than 350 or dialysis dependent
11. Abciximab within seven days, eptifibitide or tirofiban within 12 hours
12. Any other medical condition, or the presence of extreme age or general frailty which would lead operator to reduce dose or omit anticoagulants in normal practice

Date of first enrolment
01/11/2006

Date of final enrolment
01/04/2008
