Scientific Title

Effect of progesterone administration on the duration of pregnancy after in vitro fertilisation (IVF)/ intra-cytoplasmic sperm injection (ICSI): a prospective randomised study

Study objectives
Treatment with progesterone is emerging as the standard of care for prevention of preterm delivery in women at high risk for preterm birth. Randomised controlled trials (RCTs) have generally shown efficacy in reducing the rate of recurrent preterm delivery in women with singleton pregnancies who were at high risk for preterm labour and delivery. Most of the successful trials have employed 17-alpha-hydroxyprogesterone caproate, and one trial has reported positive results using progesterone vaginal suppositories. Very few trials of progestogens have been reported for women at risk for preterm delivery because of multiple gestations.

Ethics approval required
Old ethics approval format

Ethics approval(s)
The Egyptian IVF-ET Center Ethics Committee. Date of approval: 17/06/2008 (ref: 4/2008)

Study design
Randomised controlled trial

Primary study design
Interventional

Study type(s)
Prevention

Health condition(s) or problem(s) studied
Prevention of preterm labour after IVF/ICSI

Interventions
Intervention group: Natural progesterone will be administered in the form of natural Prontogest® 400 mg daily through the vaginal route (pessaries). Progesterone administration will continue until delivery.
Control group: Standard care only

Serum progesterone will be measured at start of trial (20 weeks gestation) and at 32 weeks gestation in all participants.

Intervention Type
Other

Phase
Not Specified

Primary outcome(s)
Delivery <37 weeks' gestation.

Key secondary outcome(s))

1. Neonatal outcome
2. Incidence of prematurity
3. Admission to neonatal intensive care unit (ICU)
4. Complication of prematurity

Completion date
30/12/2009

Eligibility

Key inclusion criteria
Healthy women who became pregnant after IVF/ICSI (singleton or twin). Randomisation will be carried out, on average, during the 20th week of gestation.

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Adult

Sex
Female

Key exclusion criteria
1. Rupture of membranes
2. Smokers
3. Major known foetal anomalies
4. Uterine anomalies
5. Cervical cerclage
6. Treatment during this pregnancy with progesterone after 12 weeks' gestation (use up to 10 weeks' gestation is permitted)
7. Contraindications to tocolysis, including foetal distress, chorioamnionitis, preeclampsia, hemodynamic instability
8. Patients treated with oral beta adrenergics for asthma
9. Age <18 years

Date of first enrolment
01/07/2008

Date of final enrolment
30/12/2009
