Study information

Scientific Title

Effect of intraoperative infiltration with local anaesthesia on the development of chronic pain after inguinal hernia repair: a randomized, triple-blinded, placebo-controlled trial.

Study objectives

We hypothesize that intra-operative infiltration with local anaesthesia (bupivacain) will lead to 50% reduction of the occurrence of chronic postoperative pain after inguinal hernia repair.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Local Ethical Committee of the Canton Lucerne, approved on 1 May 2006, amended on 26 February 2007 (ref: 585)

Study design

A randomized, placebo-controlled, triple-blinded and group sequential study.

Primary study design

Interventional

Study type(s)

Not Specified

Health condition(s) or problem(s) studied

Inguinal hernia

Interventions

Intervention group: Intraoperative injection of 20 ml bupivacain (0.25%) during inguinal hernia repair

Control group: Intraoperative injection of saline during inguinal hernia repair

Intervention Type

Other

Phase

Not Specified

Primary outcome(s)

Occurrence of chronic pain (persistent pain at three-month follow-up measured by Visual Analogue Scale and Pain Matcher®) in the operated groin region.

Key secondary outcome(s)

The following will be measured at 1-, 3- and 12-month follow-up:

1. Level of pain: Pain Matcher®, VAS, areas of hyperalgesia, hypaesthesia
2. Hospitalization: Length of stay (days), American Society of Anesthesiologists (ASA)

Classification, beginning of mobilisation (days)

3. Function: Return to work or normal activity (days and %), Quality of life (36-item Short Form health survey [SF-36])

Completion date

01/08/2008

Eligibility

Key inclusion criteria

1. 18 years or older
2. Primary or recurrent single or double sided symptomatic but not incarcerated inguinal hernias with an elective hernia repair
3. Written informed consent

Participant type(s)

Patient

Healthy volunteers allowed

No

Age group

Adult

Lower age limit

18 years

Sex

All

Key exclusion criteria

1. Patients with legal incompetence
2. Pregnant and nursing women
3. Presence or history of active malignancy or systemic diseases
4. Under immunosuppressive treatment
5. Systemic or severe local inflammation or infection
6. Wound healing disorders
7. Physical or mental incapacity, which makes it impossible to obtain informed consent
8. Patients with pacemakers or other implanted electrical devices (as pacemakers interfere with the electrical stimulation of the Pain Matcher® and vice versa)
9. Other types of hernia (e.g. umbilical hernia)

Date of first enrolment
