Plain English summary of protocol

Background and study aims
Extrachromosomal circular DNA (eccDNA) has long been known to form from proto-oncogenes which are normal genes present in the human genome which, when altered by mutation, can become a gene that can contribute to cancer (an oncogene). The formation of eccDNA has also been linked to aging.

The levels of eccDNA circulating in the body outside of cells in type 2 diabetes patients have not previously been investigated. The aim of this study is to assess the levels of serum of eccDNA in newly diagnosed type 2 diabetes patients.

Who can participate?
Newly diagnosed type 2 diabetes patients and healthy volunteers.

What does the study involve?
Participants will provide blood samples which will be tested to find eccDNA that are present at high or low levels in newly diagnosed type 2 diabetes.

What are the possible benefits and risks of participating?
There is no direct benefit to the participant by taking part in this study. Data collected may be used to support future clinical studies in this population.

There are no risks of participating in this study. Participants will receive treatment for their illness that follows the National Chinese guidelines for treating this type of illness.

Where is the study run from?
The First Affiliated Hospital of Wannan Medical College, Yijishan Hospital (China)

When is the study starting and how long is it expected to run for?
From May 2020 to May 2021

Who is funding the study?
The National Natural Science Foundation of China (China) and "Peak" Training Program for Scientific Research of Yijishan Hospital, Wannan Medical College (China)

Who is the main contact?
Prof. Xiang Kong
wnmcyaolikx@sina.com

Additional identifiers

Study information

Scientific Title
Pilot study to assess abnormal expression of serum extrachromosomal circular DNA between newly diagnosed type 2 diabetes mellitus patients and healthy participants.

Study objectives
To determine the abnormal expression of cell-free circulating extrachromosomal circular DNA in newly diagnosed type 2 diabetes mellitus patients.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Approved 20/07/2020, Scientific Research and New Technology Ethics Committee of Wannan Medical College Yijishan Hospital (2 Zheshanxi Rd, Wuhu, 241001, China; +86 (0)5535939912; lvkun315@126.com), ref: 2020022

Study design

Observational study of cases and controls

Primary study design
Observational

Study type(s)
Diagnostic

Health condition(s) or problem(s) studied
Type 2 diabetes mellitus

Interventions
Peripheral blood samples will be collected from newly diagnosed type 2 diabetes mellitus patients and healthy participants. Serum DNA extractions were performed using QIAamp Circulating Nucleic Acid Kit (Qiagen). For elimination of linear DNA and enrichment of eccDNA, 25 ng of plasma/serum DNA will be treated with 5 units of Plasmid-Safe ATP-dependent DNase (Epicentre) in a 50 µl reaction system at 37°C for 5 min, followed by column purification using MinElute Reaction Cleanup Kit (Qiagen). EccDNA enriched from 25 ng of plasma/serum DNA will be processed using Nextera XT DNA Library Preparation Kit (Illumina). DNA libraries will be sequenced on Illumina NovaSeq 6000 with 150 bp paired end mode according to the manufacturer's instructions. Real-time PCR will be used to verify the differentially expressed eccDNA candidates. The correlation between the differentially expressed eccDNA and other clinical factors will also be evaluated.

Intervention Type
Other

Primary outcome(s)
1. Serum eccDNA levels in peripheral blood samples of newly diagnosed type 2 diabetes mellitus patients measured using high throughput sequencing at the time of data collection

Key secondary outcome(s))
1. Clinical factors associated with the differentially expressed eccDNA measured using patient records at the time of data collection

Completion date
01/07/2021

Eligibility

Key inclusion criteria
1. Type 2 diabetes mellitus diagnosed according to the 1999 World Health Organization diagnostic criteria

Participant type(s)
All

Healthy volunteers allowed
No

Age group
Adult

Sex
All

Total final enrolment
146

Key exclusion criteria
1. No clinical evidence of severe kidney or liver diseases, chronic viral or bacterial infection, inflammatory diseases, tumors, or diabetic ketoacidosis

Date of first enrolment
21/07/2020

Date of final enrolment
01/03/2021
