Plain English summary of protocol

Background and study aims
Eye movement desensitization and reprocessing (EMDR) is a type of therapy used for post-traumatic stress disorder (PTSD). By encouraging patients to focus on a traumatic memory while simultaneously receiving stimuli in a rhythmic left-right pattern, such as eye movements, the therapy has been associated with a reduction in traumatic stress symptoms. The main aim of the proposed research is to determine whether remotely delivered EMDR has the potential to reduce traumatic stress symptoms in British military veterans with combat-related PTSD.

Who can participate?
Adult patients who meet specific criteria for combat-related PTSD

What does the study involve?
This is an exploratory study to assess fidelity, adherence and factors that influence the outcome. All treatment will be delivered through Veterans' NHS Wales. Face-to-face treatment will occur in usual clinics; remote treatment will take place via Attend Anywhere. All recruitment and research interviews will be undertaken remotely.

The main aim of the proposed research is to determine whether remotely delivered EMDR has the potential to reduce traumatic stress symptoms in British military veterans with combat-related PTSD.

The main objective is to answer the following research questions:
1. For British military veterans with combat-related PTSD, does remotely delivered EMDR reduce symptoms of PTSD to a significantly greater degree than a waiting list?
2. For British military veterans with combat-related PTSD, does remotely delivered EMDR reduce symptoms of PTSD to a similar degree as face-to-face delivered EMDR?
3. For British military veterans with combat-related PTSD, what is the impact of remotely delivered EMDR on quality of life, functioning, symptoms of depression, symptoms of anxiety,

insomnia, alcohol and illicit substance use, and perceived social support?
4. Is remotely delivered EMDR acceptable to British military veterans with combat-related PTSD and those delivering the intervention?
5. What is the likely effect size of remotely delivered EMDR?
6. What factors may impact the effect and successful roll-out of remotely delivered EMDR for combat-related PTSD, if it is shown to be effective?
7. Can the results from this study be used in the planning of a phase III definitive trial?
8. Is a phase III study advisable and feasible?

What are the possible benefits and risks of participating?
Benefits and risks not provided at time of registration

Where is the study run from?
Cardiff University (United Kingdom)

When is the study starting and how long is it expected to run for?
July 2021 to August 2024

Who is funding the study?
1. Health and Care Research Wales (United Kingdom)
2. TEC Cymru (United Kingdom)

Who is the main contact?
Prof Jonathan Bisson (United Kingdom)
bissonJI@cardiff.ac.uk

Study information

Scientific Title
Feasibility randomised controlled trial of remotely delivered eye-movement desensitisation and reprocessing (EMDR) versus face-to-face EMDR for post-traumatic stress disorder (PTSD) in military veterans

Study objectives
The study proposes that remotely delivered eye-movement desensitisation and reprocessing (EMDR) has the potential to reduce traumatic stress symptoms in British military veterans with combat-related PTSD

Ethics approval required
Old ethics approval format

Ethics approval(s)
Approved 21/04/2022, Wales Research Ethics Committee 5 (Health and Care Research Wales, Castlebridge 4, 15-19 Cowbridge Road East, Cardiff, CF11 9AB, United Kingdom; +44 (0)1686 252101, +44 (0)2920 230457, +44 (0)7920 565664; Wales.REC5@wales.nhs.uk), ref: 22/WA/0062

Study design
Exploratory single-blind randomized parallel-group-assigned controlled trial

Primary study design
Interventional

Study type(s)
Treatment

Health condition(s) or problem(s) studied
Combat-related post-traumatic stress disorder (PTSD)

Interventions
Study design:
The study will be an exploratory single-blind randomised parallel group controlled trial with nested process evaluation to assess fidelity, adherence and factors that influence the outcome.

Setting:
All treatment will be delivered through Veterans' NHS Wales. Face-to-face treatment will occur in usual clinics; remote treatment will take place via Attend Anywhere. All recruitment and research interviews will be undertaken remotely.

Sample size:
A standard power calculation is not appropriate for a Phase II exploratory trial but, based on

previous research, we believe that a sample size of 20 per group will be sufficient to allow us to achieve our objectives.
For the qualitative arm of the study, the sample size will be guided by preliminary analysis and constant comparison (comparing and contrasting themes from other interviews) during each data collection phase, until the research team is satisfied that there is data saturation and no new themes which are important to the research question arise.
However, it is helpful to have a guide to sample size for study planning. Based on previous research, we propose that interviews will be conducted with around 10 participants who receive treatment remotely, purposively sampled, and all therapists.

Groups:
1. Eye-movement desensitisation and reprocessing (EMDR) delivered remotely
2. Eye-movement desensitisation and reprocessing (EMDR) delivered face-to-face
3. Waiting list

Intervention Type
Behavioural

Primary outcome(s)
Diagnosis and severity of PTSD measured using the Clinician-Administered PTSD Scale for DSM-5 (CAPS-5) at baseline, 20 and 40 weeks after randomisation

Key secondary outcome(s))
1. Presence and severity of PTSD symptoms measured using the PTSD Checklist (PCL) at baseline, 20 and 40 weeks after randomisation
2. Core symptoms of PTSD and complex PTSD measured using the International Trauma Questionnaire (ITQ) at baseline, 20 and 40 weeks after randomisation
3. Impairment in functioning measured using the Work and Social Adjustment Scale (WSAS) at baseline, 20 and 40 weeks after randomisation
4. Severity of depression measured using the Patient Health Questionnaire (PHQ-9) at baseline, 20 and 40 weeks after randomisation
5. Severity of generalised anxiety disorder (GAD) measured using the GAD-7 assessment at baseline, 20 and 40 weeks after randomisation
6. Alcohol harm measured using the Alcohol Use Disorders Test (AUDIT-O) at baseline, 20 and 40 weeks after randomisation
7. Nature, severity, and impact of insomnia measured using the Insomnia Severity Index (ISI) at baseline, 20 and 40 weeks after randomisation
8. Health-related, quality of life measured using the EQ5D-5L at baseline, 20 and 40 weeks after randomisation
9. Digital skills measured using a Digital Ability questionnaire at baseline

Completion date
29/08/2024

Reason abandoned (if study stopped)
Lack of staff/facilities/resources

Eligibility

Key inclusion criteria

1. Aged 18 years old and over
2. Informed consent
3. Meet DSM5 criteria for combat-related PTSD
4. Access to stable internet access in a private location

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Adult

Lower age limit
18 years

Sex
All

Key exclusion criteria
1. Psychosis
2. DSM5 severe major depressive episode
3. Substance dependence
4. Change in psychotropic medication within one month
5. Suicidal intent

Date of first enrolment
10/10/2022

Date of final enrolment
19/08/2024
