Plain English summary of protocol

Background and study arms

Ashwagandha (ASH) has long been used in the traditional Ayurvedic system of medicine to enhance memory and improve cognition. Human intervention studies have linked Ashwagandha to increased cognition in patients with early dementia or bipolar disorder, but studies in healthy populations are limited. It is currently unknown if one-time supplementation with Ashwagandha can improve cognitive performance in young healthy adults. The aim of this study is to examine the effect of acute ingestion of 400 mg of ashwagandha on executive function including general attention, sustained attention, attentional shifting, and/or working memory in young adults.

Who can participate?

Healthy men and women between the ages of 18 to 59 years

What does the study involve?

Participants will be randomly allocated to receive ASH or placebo (dummy) capsules, and then perform four cognitive function tests that assess a range of cognitive and executive function aspects.

What are the possible benefits and risks of participating?

The potential benefit of participating is an increase in executive functioning.

Where is the study run from?

Texas A&M University (USA)

When is the study starting and how long is it expected to run for?

April 2019 to November 2019.

Who is funding the study?

Specnova Inc. (USA)

Who is the main contact?

Dr Richard B. Kreider

Study information

Scientific Title

The effect of acute ashwagandha supplementation on cognitive function

Study objectives

Acute ashwagandha extract improves cognition.

Ethics approval required

Old ethics approval format

Ethics approval(s)

Approved 19/07/2019, Texas A&M University Institutional Review Board (517 Blocker Building, 155 Ireland Street, Texas A&M University, College Station, TX 778431, USA; +1 (0)979 458 4067; irb@tamu.edu), ref: IRB2019-0453D

Study design

Interventional double-blinded randomized crossover controlled trial

Primary study design

Interventional

Study type(s)

Other

Health condition(s) or problem(s) studied

Improving cognition in healthy individuals

Interventions

Subjects consumed capsules containing 400 mg of a proprietary root and leaves extract of ashwagandha (NooGandha®, Specnova, Boca Raton, FL, USA) or capsules containing 400 mg of a wheat flour placebo (Placebo) once they have completed baseline testing with 8 ounces of water. A computer generated randomization to treatment was used. Once subjects were randomized to start, they followed the counter balance progression.

Intervention Type

Supplement

Primary outcome(s)

The Psychology Experiment Building Language (PEBL) software program (Version 2.1, <http://pebl.sourceforge.net>) was used to administer four cognitive function tests that assessed a range of cognitive and executive function aspects:

1. Berg-Wisconsin Card Sorting Task test (BCST) at baseline, 1, 2, 3, 4, 5 and 6 hours after ingestion
2. The Go/No-Go test (GNG) at baseline, 1, 2, 3, 4, 5 and 6 hours after ingestion
3. Sternberg Task Test (STT) at baseline, 1, 2, 3, 4, 5 and 6 hours after ingestion
4. Psychomotor Vigilance Task Test (PVTT) at baseline, 1, 2, 3, 4, 5 and 6 hours after ingestion

Key secondary outcome(s)

There are no secondary outcome measures

Completion date

10/11/2019

Eligibility

Key inclusion criteria

Apparently healthy males and females between the ages of 18 to 59 years were recruited to participate in the study.

All subjects were healthy and free from known:

1. Cognitive deficit conditions
2. Wheat flour allergies
3. Sleep disorders
4. Cardiovascular, metabolic, or pulmonary diseases
5. History of hypertension, migraine headaches, cardiac arrhythmias, or anxiety
6. Gastrointestinal reflux disease or ulcers

Participant type(s)

Healthy volunteer

Healthy volunteers allowed

No

Age group

Adult

Lower age limit

18 years

Upper age limit

59 years

Sex
