Plain English summary of protocol

Background and study aims

Sleep problems in school-aged children have increased threefold during the last 30 years. The amount of sleep that children and adolescents have appears to have reduced by about an hour over the last 100 years. Meanwhile, the number of overweight and obese children is increasing, putting those affected at risk of cardiovascular and other diseases. Both short and overly long periods of sleep are associated with being overweight as an adult. It is important to investigate the activity habits that may affect sleep, for example access to bedroom TV, time spent on computer, television and other screens, as well as exercise. The overarching aim of this study is to longitudinally (that is, over a period of time) investigate sleep and media habits, body image, activity and body mass index in school-aged children and adolescents.

Who can participate?

All students in grades 1,4,8 at schools in the municipality of Lund.

What does the study involve?

Participants complete a survey questionnaire given during the regular visit to the school nurse. Height and weight are also measured at this time.

What are the possible benefits and risks of participating?

One benefit of the survey might be that it opens up a possibility for the student to discuss sleep and lifestyle factors with the school nurse. A risk is that, although the study is a voluntary one, the students will assume that they have to participate because the school nurse requests them to. The school nurses are therefore carefully informed that they have to highlight the voluntary nature of the study.

Where is the study run from?

Kristianstad University (Sweden)

When is the study starting and how long is it expected to run for?

March 2008 to June 2020

Who is funding the study?

Kristianstad University (Sweden)

Who is the main contact?
Mrs Pernilla Garmy

Study information

Scientific Title
Sleep and lifestyle in school age children: a longitudinal study

Study objectives
The study's hypothesis is that sleep and media habits, body image, exercise habits, academic success and body mass index are interrelated.

Ethics approval required

Sleep problems, obesity

Interventions

This is a longitudinal survey study where we are investigating sleep duration, BMI and media habits with questionnaires and height and weight measures. Each observation takes approximately 20 minutes (a visit at the school nurse) and this is repeated 4 times (in grades 1, 4, 8 and 10).

Intervention Type

Other

Primary outcome(s)

1. Sleep and media habits among school-aged children and adolescents. Survey at four time-points: grades 1, 4, 8 and 10. Survey questionnaire concerns sleep and media habits
2. Body Mass Index among school-aged children and adolescents. Height and lengths are measured by trained school nurses at four time-points: grades 1, 4, 8 and 10
3. Physical activity, body image and self-rated health among adolescents. Survey at two time-points: grades 8 and 10. Survey questionnaire concerns frequency of exercise, self-reported fitness, body image and self-rated health

Key secondary outcome(s)

1. Validity and reliability test of the Minimal Insomnia Symptom Scale (MISS). Survey at two time-points: grades 8 and 10. Survey questionnaire consists of three questions concerning falling asleep, waking during the night and rested by sleep

Completion date

30/06/2020

Eligibility

Key inclusion criteria

Current version as of 21/03/2018:

All students in grades 1, 4, 8 and 10 in seven municipalities in southern Sweden.

Previous version:

All students at schools in the municipality of Lund in grades 1, 4, 8 and 10.

Participant type(s)
