## Plain English summary of protocol

Background and study aims
Miscarriage is where a woman loses the baby she is carrying. It is the most common complication of pregnancy, affecting 15-25% of pregnancies bringing the total in England to approximately 125,000 per year. Miscarriage often brings not only physical pain, bleeding and risks of infection, but also emotional issues on women and their families. A missed miscarriage, also known as a missed abortion or a silent miscarriage, occurs when the baby dies, but the body does not recognise this and so the pregnancy sac (where the baby grows) stays inside the body. Women who have had a missed miscarriage often opt for medical management up to 13+6 weeks of pregnancy. NICE currently recommends that a drug called misoprostol (a vaginal pessary (medication inserted into the vagina) or tablet that makes the womb contract) should be used in the medical treatment of miscarriage. However, there is evidence to suggest that combining this drug with mifepristone (an oral tablet that reduces pregnancy hormones) may be more effective in treating miscarriage. The aim of this study is to find out whether treating women with mifepristone followed by misoprostol, is more effective than misoprostol alone at resolving missed miscarriage.

Who can participate?
Women aged 16 years and over who have been diagnosed with a missed miscarriage

What does the study involve?
Participants are randomly allocated to one of two groups. Those in the first group receive mifepristone followed by misoprostol and those in the second group receive a dummy drug (placebo) followed by misoprostol. Neither the participants nor the researchers know which women receive which drug. Women in both groups are then monitored for 7 days to find out how many miscarriages are resolved (complete) in each group. If miscarriage is not complete then further treatment (more tablets or surgery) is offered.

What are the possible benefits and risks of participating?
It is not known whether women will benefit personally from taking part in this study, but the knowledge gained thanks to their help will inform future treatment and potentially lead to improved treatment of miscarriage for women in the future. Mifepristone blocks the action of the hormone progesterone to help speed up the process of miscarriage. As a consequence, patients may experience increased vaginal bleeding. All patients who take part will receive misoprostol, which helps the uterus contract to push out the pregnancy tissue and can cause period-like cramps, sickness, diarrhoea and flu-like symptoms. If patients have any concerns, they are advised to contact the research nurse/midwife at their hospital. Patients will be provided with a card to carry and give to anyone treating them, informing them that they are taking part in this study.

Where is the study run from?
1. Birmingham Women's Hospital (UK)
2. Queen Alexandra Hospital, Portsmouth (UK)
3. Queen's Medical Centre, Nottingham (UK)
4. Sunderland Royal Hospital (UK)
5. University Hospital Coventry (UK)
6. Royal London Hospital (UK)
7. Whipps Cross Hospital (UK)
8. Newham University Hospital (UK)
9. Birmingham Heartlands Hospital (UK)
10. Glasgow Royal Infirmary (UK)
11. Queen Elizabeth University Hospital, Glasgow (UK)
12. King's College Hospital (UK)
13. Liverpool Women's Hospital (UK)
14. Princess Anne Hospital, Southampton (UK)
15. Royal Infirmary of Edinburgh (UK)
16. Royal Victoria Infirmary, Newcastle (UK)
17. St Thomas' Hospital (UK)
18. St Michael's University Hospital, Bristol (UK)
19. University College Hospital, London (UK)
20. Epsom Hospital (UK)
21. Southmead Hospital (UK)
22. West Middlesex Hospital (UK)
23. Chelsea and Westminster Hospital (UK)
24. Princess Royal Hospital (UK)
25. Singleton Hospital (UK)
26. Princess of Wales Hospital (UK)
27. Burnley General Hospital (UK)
28. St Helier Hospital (UK)

When is the study starting and how long is it expected to run for?
February 2017 to July 2020 (updated 31/03/2020, previously: January 2020)

Who is funding the study?
National Institute for Health Research (UK)

Who is the main contact?
Mrs Leanne Beeson
l.e.beeson@bham.ac.uk

# Study information

### Scientific Title
A randomised placebo-controlled trial of mifepristone and misoprostol versus misoprostol alone in the medical management of missed miscarriage

### Acronym
MifeMiso

### Study objectives
Current study hypothesis as of 10/05/2018:
Treatment with mifepristone plus misoprostol is superior to misoprostol alone for the resolution of miscarriage within 7 days in women diagnosed with missed miscarriage by pelvic ultrasound scan in the first 13+6 weeks of pregnancy.

Previous study hypothesis:
Treatment with mifepristone plus misoprostol is superior to misoprostol alone for the resolution of miscarriage within 7 days by at least 10% in women diagnosed with missed miscarriage by pelvic ultrasound scan in the first 13+6 weeks of pregnancy.

## Ethics approval required
Old ethics approval format

## Ethics approval(s)
14/02/2017, ref: 17/WM/0017

## Study design
Randomised; Interventional; Design type: Treatment, Drug

## Primary study design
Interventional

## Study type(s)
Treatment

## Health condition(s) or problem(s) studied
Miscarriage

## Interventions
Current interventions as of 10/05/2018:
Participants will be randomised on-line via a secure internet facility in a 1:1 ratio through a third party independent Integrated Trial Management System (MedSciNet Clinical Trial Framework). A “minimisation” procedure using a computer-based algorithm will be used to avoid chance imbalances in the following important variables: Maternal age (<30, ≥30 years), body mass index (<35, ≥35 kg/m2), previous parity (nulliparous, parous women), gestational age (<70, ≥70 days), amount of bleeding (PBAC score; ≤2, ≥3) and randomising centre.
710 women in total will be randomised; 355 participants each in the mifepristone and placebo arms.
Participants in the mifepristone arm will receive a single dose of oral mifepristone 200 mg, followed by a single dose of vaginal, oral or sublingual misoprostol 800 mcg 2 days later.
Participants in the placebo arm will receive a single oral placebo tablet followed by a single dose of vaginal, oral or sublingual misoprostol 800 mcg 2 days later
All women will be clinically followed up until they are discharged upon confirmation of a negative pregnancy test result and resolution of the miscarriage. Upon discharge all women will be requested to complete a follow up EQ-5D-5L questionnaire and Qualitative Patient Satisfaction Questionnaire which should be returned as soon as possible following discharge. A subset of women will be selected for an in depth interview to discuss the treatment they received up to 6 weeks after discharge based on their responses to the Qualitative Patient Satisfaction Questionnaire.

## Intervention Type
Drug

## Phase
Phase III

## Drug/device/biological/vaccine name(s)
Mifepristone

## Primary outcome(s)
Current primary outcome measure as of 09/08/2019:
Failure to spontaneously pass the gestational sac within 7 days after randomisation is assessed within 7 days after randomisation by pelvic ultrasound scan (where possible)

Previous primary outcome measure from 10/05/2018 to 09/08/2019:
Failure to spontaneously pass the gestational sac within 7 days after randomisation is assessed within 7 days after randomisation by pelvic ultrasound scan

Original primary outcome measure:
Failure to spontaneously pass gestational sac within 7 days after start of the medical treatment is assessed within 7 days after start of medical treatment by pelvic ultrasound scan.

## Key secondary outcome(s))
Current secondary outcome measures as of 09/08/2019:
Key Secondary Outcome:
Surgical intervention to resolve the miscarriage (collected up to discharge from EPU care) is assessed from randomisation until discharge up to approximately 8 weeks by clinical review (surgical intervention information recorded on the Outcomes CRF)

Other Secondary Outcomes:
1. Surgical intervention to resolve the miscarriage up to and including day 7 post-randomisation is assessed from randomisation until day 7 post-randomisation by clinical review (surgical intervention information recorded on the Outcomes CRF)
2. Surgical intervention to resolve the miscarriage after day 7 post-randomisation to discharge from EPU care is assessed from day 8 post-randomisation until discharge up to approximately 8

weeks by clinical review (surgical intervention information recorded on the Outcomes CRF)
3. Need for further doses of misoprostol up to day 7 post-randomisation is assessed after initial 800 mcg dose of misoprostol at day 2 until day 7 post-randomisation (information collected on Outcomes case report form [CRF])
4. Need for further doses of misoprostol up to discharge from EPU care is assessed after initial 800 mcg dose of misoprostol at day 2 until discharge by clinical review (information collected on Outcomes case report form [CRF])
5. Overall patient satisfaction score is assessed within 6 weeks of discharge from EPU care using the CSQ-8 Client Satisfaction Questionnaire
6. Patient quality of life (Index value and overall health status) is assessed using the EQ-5D-5L questionnaire and collected on date of randomisation, day 6-7 post-randomisation or day of follow-up USS if different to day 6-7 and day 21 +/- 2 days post-randomisation. If a woman obtains an initial positive pregnancy test result at day 21 +/- 2 days post-randomisation then a further EQ-5D-5L questionnaire is collected upon discharge from EPU care)
7. Duration of bleeding reported by woman (days) is assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by the patient self-reporting (information recorded on the Outcomes CRF)
8. Diagnosis of infection associated with miscarriage requiring outpatient antibiotic treatment is assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by clinical review (information recorded on the Outcomes CRF)
9. Diagnosis of infection associated with miscarriage requiring inpatient antibiotic treatment is assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by clinical review (information recorded on the Outcomes CRF)
10. Negative pregnancy test result 21 days (+/- 2 days) after randomisation is assessed 21 days (+/- 2 days) after randomisation by patient performed pregnancy test (information recorded on the Outcomes CRF)
11. Time from randomisation to discharge from EPU care (described using summary statistics only) is measured in days, assessed up to approximately 8 weeks by calculating the days between randomisation (recorded on the Randomisation form) and discharge from EPU care (recorded on the Outcomes CRF)
12. Outpatient or emergency visits are recorded from randomisation until discharge from EPU care, up to approximately 8 weeks by reviewing patient notes (recorded on the Outcomes CRF)
13. Inpatient admissions (nights in hospital) are assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by reviewing patient notes (recorded on the Outcomes CRF)

Safety Outcomes:
1. Blood transfusion required is assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by clinical review (information recorded on the Outcomes CRF)
2. Side effects are measured from randomisation until discharge from EPU care, assessed up to approximately 8 weeks by clinical review and/or patient self-reporting (adverse events and serious adverse events recorded on respective forms)
3. Death is assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by clinical review (recorded on SAE form)
4. Any serious complications is assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by clinical review (recorded on SAE form)

Previous secondary outcome measured from 10/05/2018 to 09/08/2019:
1. Need for further doses of misoprostol up to day 7 post-randomisation is assessed after initial 800 mcg dose of misoprostol at day 2 until day 7 post-randomisation (information collected on Outcomes case report form [CRF])
2. Need for further doses of misoprostol up to discharge from EPU care is assessed after initial

800 mcg dose of misoprostol at day 2 until discharge by clinical review (information collected on Outcomes case report form [CRF])
3. Time from randomisation to passage of gestational sac is assessed up to approximately 8 weeks by calculating the days between randomisation (recorded on the Randomisation form) and passage of the gestational sac (recorded on the Outcomes CRF)
4. Time from active treatment (defined as mifepristone in the active group and misoprostol in the placebo group) commencement to passage of gestational sac is assessed up to approximately 8 weeks by calculating the days between active treatment commencement (mifepristone/misoprostol; recorded on the Outcomes CRF) and passage of the gestational sac (also recorded on the Outcomes CRF)
5. Surgical intervention to resolve the miscarriage (collected up to discharge from EPU care) is assessed from randomisation until discharge up to approximately 8 weeks by clinical review (surgical intervention information recorded on the Outcomes CRF)
6. Overall patient satisfaction score is assessed within 6 weeks of discharge from EPU care using the CSQ-8 Client Satisfaction Questionnaire
7. Patient quality of life (Index value and overall health status) is assessed using the EQ-5D-5L questionnaire and collected on date of randomisation, day 6-7 post-randomisation or day of follow-up USS if different to day 6-7 and day 21 +/- 2 days post-randomisation. If a woman obtains an initial positive pregnancy test result at day 21 +/- 2 days post-randomisation then a further EQ-5D-5L questionnaire is collected upon discharge from EPU care)
8. Blood transfusion required is assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by clinical review (information recorded on the Outcomes CRF)
9. Duration of bleeding reported by woman (days) is assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by the patient self-reporting (information recorded on the Outcomes CRF)
10. Diagnosis of infection associated with miscarriage requiring outpatient antibiotic treatment is assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by clinical review (information recorded on the Outcomes CRF)
11. Diagnosis of infection associated with miscarriage requiring inpatient antibiotic treatment is assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by clinical review (information recorded on the Outcomes CRF)
12. Negative pregnancy test result 21 days (+/- 2 days) after randomisation is assessed 21 days (+/- 2 days) after randomisation by patient performed pregnancy test (information recorded on the Outcomes CRF)
13. Time from randomisation to discharge from EPU care is measured in days, assessed up to approximately 8 weeks by calculating the days between randomisation (recorded on the Randomisation form) and discharge from EPU care (recorded on the Outcomes CRF)
14. Side effects are measured from randomisation until discharge from EPU care, assessed up to approximately 8 weeks by clinical review and/or patient self-reporting (adverse events and serious adverse events recorded on respective forms
15. Death is assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by clinical review (recorded on SAE form)
16. Any serious complications is assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by clinical review (recorded on SAE form)
17. Outpatient or emergency visits are recorded from randomisation until discharge from EPU care, up to approximately 8 weeks by reviewing patient notes (recorded on the Outcomes CRF)
18. Inpatient admissions (nights in hospital) are assessed from randomisation until discharge from EPU care, up to approximately 8 weeks by reviewing patient notes (recorded on the Outcomes CRF)

Original secondary outcome measures:
1. Need for further doses of misoprostol is assessed after initial 800mcg dose of misoprostol at

day 2 until discharge by clinical review (information collected on Outcomes case report form [CRF])
2. Time from randomisation to passage of gestational sac is assessed up to 8 weeks by calculating the days between randomisation (recorded on the Randomisation form) and passage of the gestational sac (recorded on the Outcomes CRF)
3. Time from active treatment commencement to passage of gestational sac is assessed up to 8 weeks by calculating the days between active treatment commencement (mifepristone /misoprostol; recorded on the Outcomes CRF) and passage of the gestational sac (also recorded on the Outcomes CRF)
4. Expulsion of the gestational sac without the need for surgery is assessed from randomisation until discharge up to 8 weeks by clinical review (surgical intervention information recorded on the Outcomes CRF)
5. Unplanned surgery is assessed from randomisation until discharge, up to 8 weeks by clinical review (surgical intervention information recorded on the Outcomes CRF)
6. Patient satisfaction is assessed within 6 weeks of discharge using the CSQ-8 Client Satisfaction Questionnaire
7. Patient quality of life is assessed at baseline, 6-7 days after start of medical treatment and upon discharge using the EQ-5D-5L questionnaire
8. Blood transfusion rate is assessed from randomisation until discharge, up to 8 weeks by clinical review (information recorded on the Outcomes CRF)
9. Days of bleeding is assessed from randomisation until discharge, up to 8 weeks by the patient self-reporting (information recorded on the Outcomes CRF)
10. Infection requiring outpatient antibiotics treatment is assessed from randomisation until discharge, up to 8 weeks by clinical review (information recorded on the Outcomes CRF)
11. Infection requiring inpatient treatment rate is assessed from randomisation until discharge, up to 8 weeks by clinical review (information recorded on the Outcomes CRF)
12. Negative pregnancy test result is assessed 21 days after start of medical treatment by patient performed pregnancy test (information recorded on the Outcomes CRF)
13. Time from start of medical treatment to discharge is measured in days, assessed up to 8 weeks by calculating the days between start of medical treatment (mifepristone/placebo; recorded on the Outcomes CRF) and passage of the gestational sac (recorded on the Outcomes CRF)
14. Side effects are measured from randomisation until discharge, assessed up to 8 weeks by clinical review and/or patient self-reporting (adverse events and serious adverse events recorded on respective forms)
15. Death or serious complication rate is assessed from randomisation until discharge, up to 8 weeks by clinical review (death information recorded on SAE form)
16. Outpatient or emergency visits are recorded from randomisation until discharge, up to 8 weeks by reviewing patient notes (recorded on the Outcomes CRF)
17. Inpatient admissions (nights in hospital) are assessed from randomisation until discharge, up to 8 weeks by reviewing patient notes (recorded on the Outcomes CRF)

### Completion date
31/07/2020

# Eligibility

### Key inclusion criteria

1. Women diagnosed with missed miscarriage by pelvic ultrasound scan in the first 13+6 weeks of pregnancy
2. Age 16 years and over
3. Willing and able to give informed consent

## Participant type(s)
Patient

## Healthy volunteers allowed
No

## Age group
Adult

## Lower age limit
16 years

## Sex
Female

## Total final enrolment
711

## Key exclusion criteria
Current participant exclusion criteria as of 10/05/2018:
1. Women opting for alternative methods of miscarriage management (expectant or surgical)
2. Diagnosis of incomplete miscarriage
3. Life-threatening bleeding
4. Contraindications to mifepristone or misoprostol use for example chronic adrenal failure, known hypersensitivity to either drug, haemorrhagic disorders and anticoagulant therapy, prosthetic heart valve or history of endocarditis, existing cardiovascular disease, severe asthma uncontrolled by therapy or inherited porphyria
5. Participation in any other blinded, placebo-controlled trials of investigational medicinal products in pregnancy
6. Previous participation in the MifeMiso trial
7. Woman not able to attend for day 6-7 ultrasound scan

Previous participant exclusion criteria:
1. Women opting for alternative methods of miscarriage management (expectant or surgical)
2. Diagnosis of incomplete miscarriage
3. Life threatening bleeding
4. Contraindications to mifepristone or misoprostol use including chronic adrenal failure, known hypersensitivity to either drug, haemorrhagic disorders and anticoagulant therapy, prosthetic heart valve or history of endocarditis, existing cardiovascular disease, severe asthma uncontrolled by therapy or inherited porphyria
5. Participation in any other blinded, placebo-controlled trials of investigational medicinal products in pregnancy
