Study information

Scientific Title
UKCCCR trial to study the effect on breast cancer mortality of annual mammographic screening starting at age 40

Acronym
The 'Age' trial

Study objectives
To determine the effectiveness of mammographic screening starting at age 40, compared with starting at age 50, in reducing mortality from breast cancer.

Ethics approval required
Old ethics approval format

Ethics approval(s)
Ethics approval from Central London REC 98/2/40.

Primary study design
Interventional

Study design
Randomised controlled trial

Study type(s)
Screening

Health condition(s) or problem(s) studied
Breast cancer

Interventions
Women in the intervention group are offered annual screening by mammography until the year of their 48th birthday. Screening is by 2-view mammography at 1st screen and single view subsequently. All women in both intervention and control groups will be invited for screening in the NHSBSP between the age of 50-52.

Intervention Type
Other

Phase
Not Applicable

Primary outcome(s)
Deaths from breast cancer in women free of the disease at trial entry in the two groups. Information on prognostic factors of all breast cancers is also collected.

Key secondary outcome(s)
Not provided at time of registration

Completion date
31/12/2010

Eligibility

Key inclusion criteria
Women aged 40-41 identified from Health Authorities registers

Participant type(s)
Patient

Healthy volunteers allowed
No

Age group
Adult

Sex
Female

Key exclusion criteria
Women under care for breast cancer may be removed from the prior notification list by the GPs prior to randomisation

Date of first enrolment
30/07/1990

Date of final enrolment
31/12/2010

Locations

Countries of recruitment
United Kingdom

England

Study participating centre
